Evandy Hostel

Detailed reconstruction analysis, numbered evidence annotations, strict implementation instructions and a consolidated Claude prompt. Recreate the buildings, entrance, internal courts, frontage and surrounding landscape.

Selected evidence

20 video snapshots: 5 from Video 1, 9 from Video 2 and 6 from Video 3. **18 selected stills:** 13 real-world photographs and 5 panorama views. The 38 selected references are reproduced with source IDs; video frames are ordered chronologically within each video.

Includes M1 current game top view and M2 real-world satellite top view. Reviewed all 18 real-world photographs, 6 panorama screenshots and all three supplied clips: Video 1 (19.30 s), Video 2 (35.27 s), Video 3 (9.43 s). Selection favours clarity, architectural coverage and complementary angles over repeated frames.

Updated evidence: the supplied game and satellite maps now support layout comparison. The game view is a flat map, so unshown 3D defects still require scene inspection. Absolute dimensions, north and some rear-building identities remain unresolved.

Source footage is retained without generated detail. Screen overlays and panorama distortion are reference artefacts, not architecture.

Map A / Real-world top view

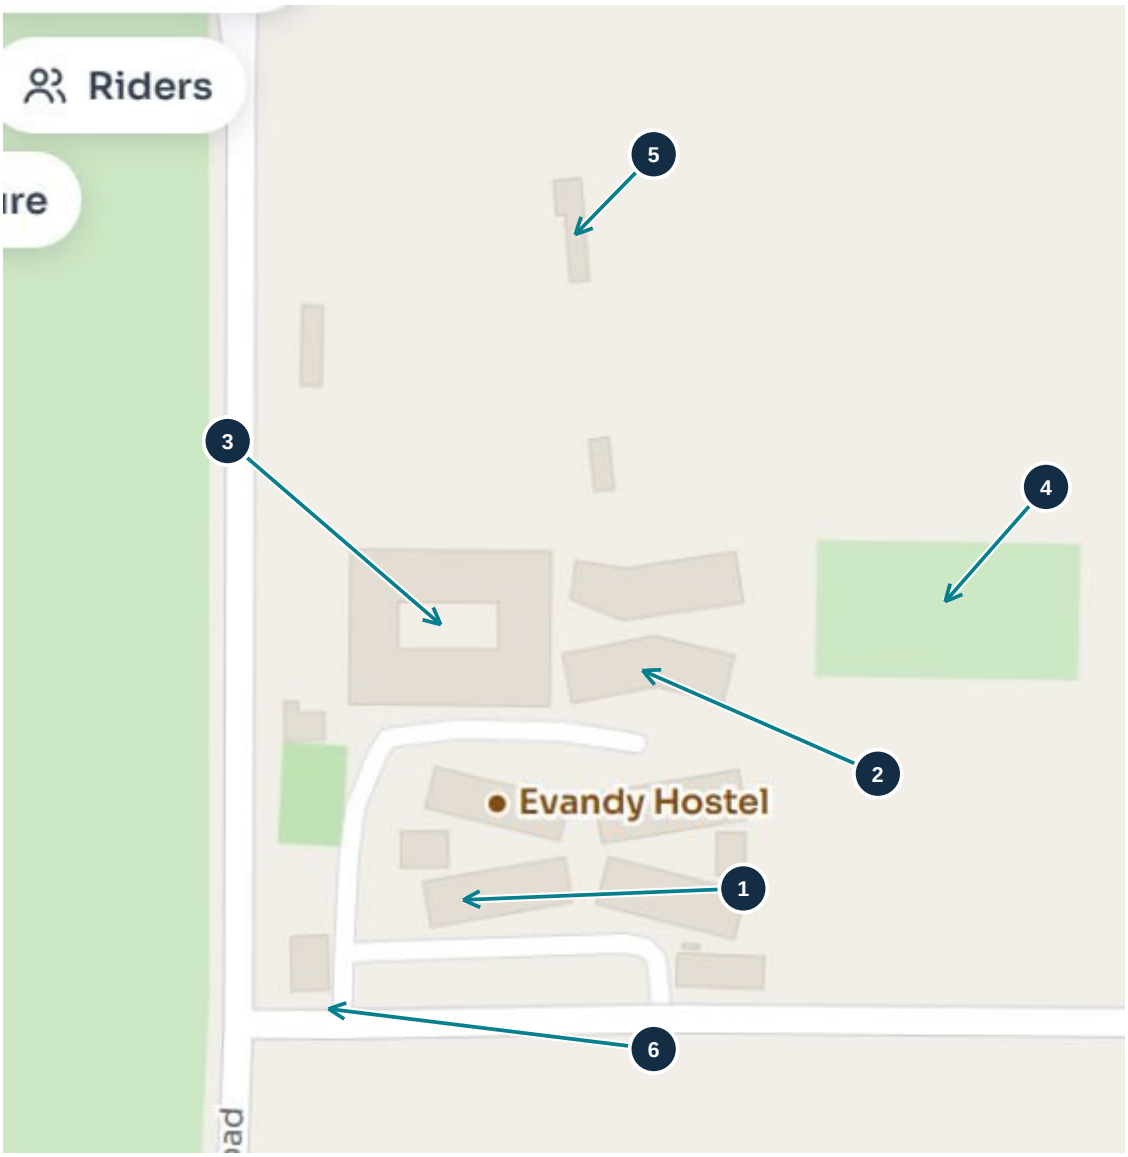

1 lower orange-roof frontage pair; **2** inner orange-roof pair; **3** upper orange-roof pair beside pink roofs; **4** pink-roof courtyard ring; **5** tree-centred court; **6** paved frontage strip; **7** map-left road; **8** bottom road; **9** unfinished/open-frame footprint; **10** open dirt field; **11** small lower-edge roofed structure.

Numbers are map targets, not official block names. The Evandy map pin lies on the lower orange-roof group; match the signed main facade through R03/R08 and the aerial before assigning it to a particular roof edge. The pink-roof group has a clear plan but its institutional/block identity remains unverified.

The red Marked Location pin is a map overlay, not a physical object. It obscures part of the upper-right building edge. The partial Bani label at the far right does not identify the visible field or every adjacent roof.

Map B / Current game top view

1-3 / Existing footprint anchors. The game map contains a ring and several detached bent/bar-like roof footprints around two internal routes. Match ring to real target 4 and upper/lower bars to real pairs 3 and 1/2 after alignment. Several narrow connecting/entry elements visible in the real plan are not resolved at this map scale.

4 / Ground-cover mismatch to inspect. The game has a simple green rectangle to the map-right; the real image has an irregular sandy/red-earth open field with vegetation margins. Verify world correspondence, then replace the blanket rectangular ground treatment with supported boundaries.

5 / Rear structures. The game shows isolated small rectangles above the ring, while the real reference has a longer open-frame footprint and yard. Align scale/crop before deciding which rectangles are missing, misplaced or stale.

6 / Roads and frontage. The map-left road, lower junction, internal approaches and small frontage structures need calibration to the real paved forecourt, boundary and road setbacks. Flat beige/white map colours are not verified wall, roof or road materials.

Map C / Layout corrections for Claude

A. Align once. Use the map-left through-road, bottom-road junction, pink ring, lower orange-roof group and central tree court to fit one scale/rotation/translation. Do not use the map pin as the building centre. The two images have different crop and scale.

B. Preserve three orange-roof pairs. The real top view shows the lower frontage pair, inner pair and upper pair beside the pink ring. Keep each roof plane, bend and offset. The game map represents these coarsely; inspect the 3D geometry before adding or merging walls.

C. Resolve connections and voids. Trace visible narrow stair/entry/link areas between lower wings while preserving courtyard gaps. Do not automatically join every nearby roof, and do not keep separations where the photographs prove a connecting mass.

D. Preserve the ring opening. Pink roof wraps an open rectangular court with inward roof slopes and small interior features. A ring footprint does not justify a solid roof over the void. Verify affiliation before naming the asset.

E. Keep tree court open. The large central tree and paved/soil circulation below the upper pair are clear landmarks. No additional residential block or universal lawn should occupy this court.

F. Add small structures deliberately. Trace the small lower-edge roof, roadside ancillary roofs, gatehouse and commercial frontage after matching photographic landmarks. The map label Administration block is a source locator, not proof that every nearby small roof has that function.

G. Correct environs. Recreate irregular open dirt field and scrub margins, red-earth yards and the upper-map open-frame structure. Do not extrude all beige polygons as finished buildings or all green areas as uniform grass.

H. Verify from both levels. Require overhead plan agreement and matched road/court-level R08/R11/R18 views. The flat game map cannot establish storey height, balcony depth, roof colour, window type or collision behaviour.

Map D / Updated registration and checks

New evidence resolves plan relationships. The satellite map corroborates the aerial roof grouping, pink courtyard ring, central tree, open dirt area and unfinished rear structure. These relationships can now guide precise project-space placement once the existing coordinate system is registered.

Still unresolved. Absolute dimensions, compass orientation, exact roof-to-facade matching for some wings, hidden elevations and the ownership of neighbouring/pink-roof structures are not established. Satellite alone cannot measure building height.

Height source remains photography/video. Use R03/R08 for the main four-tier frontage, R04/Video 2 for gallery/stair ends and Video 3/R16 for opposing wings. The new maps change footprint confidence, not the supported number of occupied floors.

Do not transplant panorama deformation. Top-view straight/bent footprints constrain facade alignment. Panorama P-series is for appearance and overlap; use its apparent curvature only as camera distortion, never as a plan curve.

Required overlay. Claude should produce a registered game overhead view over the real footprint guide, showing target numbers 1-11 in debug/review mode. Report each footprint correction and any unmatched roof fragment.

Acceptance and routes. Check all three orange-roof pairs, ring opening, central tree court, small frontage structures, open-frame yard and field margins. Ride map-left street, bottom junction, entrance approach and confirmed internal routes after geometry/collision changes.

Prompt update. The consolidated prompt later in this PDF now includes M1 game and M2 real-world maps. Use these additions together with the original 20 chronological snapshots and 18 selected stills; do not discard the close architectural references.

01 / Selection and chronology

Video 1 / aerial. Selected 1.84, 5.84, 9.84, 13.84 and 18.00 seconds. These show changing roof and courtyard relationships, road frontage, rear roofs, wooded land and the open dirt area. Near-identical intervening frames are omitted.

Video 2 / internal views. Selected 1.56, 9.44, 11.50, 17.86, 21.16, 23.50, 26.34, 28.84 and 32.84 seconds. Covers basketball court, projecting balconies, open galleries, ventilation-brick corner, gravel/red soil and the transition to circular paving/frontage.

Video 3 / close facade. Selected 0.76, 1.56, 4.30, 6.24, 7.44 and 8.80 seconds. Covers yellow/ochre vertical features, recessed balconies, railings, window rhythm, court proportions and a plainer opposing wing.

Still selection. Use R02/R15/R18 for gate approaches; R03/R08 for principal entrance; R04/R05 for building details; R06/R13 for the low commercial frontage; R11/R14 for grounds; R16/R17 for internal and street-facing wings.

Panorama selection. P01 frontage/parking context; P03 principal facade; P04 facade return and low structure; P05 gatehouse/side structure; P06 booth/notice shelter. P02 is excluded because P03 gives a clearer central elevation and P01 covers its approach context.

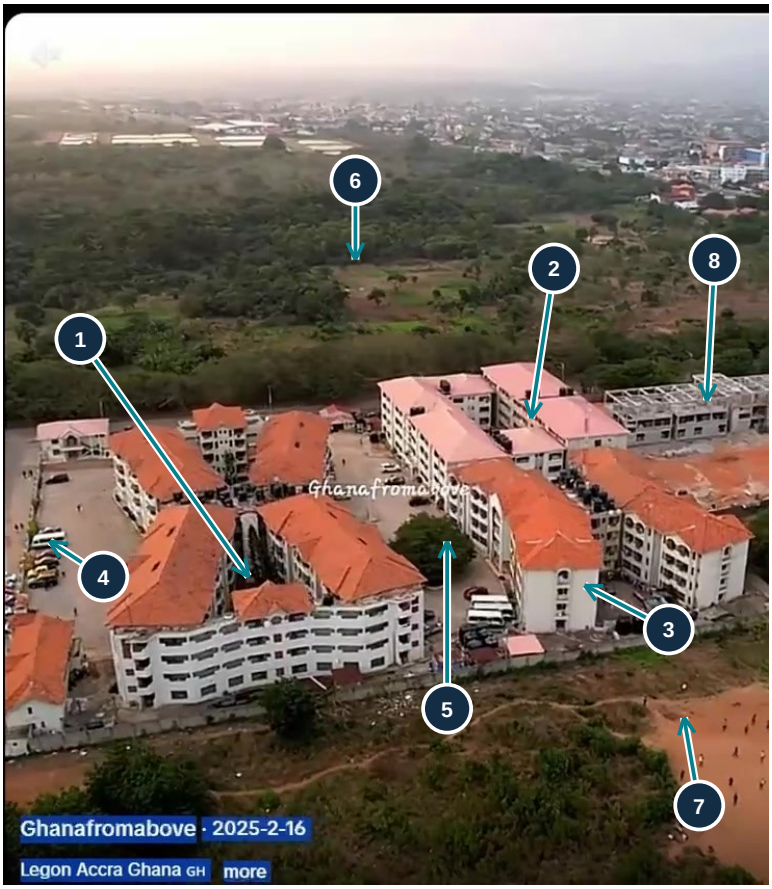

Excluded photos. R01 has much sky and foreground fence obstruction; R07 is mostly a red-earth verge already covered by R13; R09 repeats the main frontage; R10/R12 repeat the low commercial block. Exclusion means lower value for this brief, not proof of an incorrect image.

Chronology rule. Snapshots remain time-ascending within Video 1, then Video 2, then Video 3. Recording dates/order across the clips are unknown, so this is not a claim that their real-world events happened in that order.

Timestamp accuracy. Times are extraction seek positions in the supplied files, approximately one source frame (1/30 s) precision. Nearby candidate frames were checked for clarity; sharpness does not override whether a view covers a useful feature.

02 / Aerial precinct relationships

V1-05 / Video 1 at 18.00 s. Numbers here identify visible evidence zones, not official hostel blocks. The aerial frame is oblique, not a surveyed map.

1. Orange/red-roof hostel ensemble consists of several long wings and open court spaces; trace its individual roof islands and connecting masses.

2. Pink/pale-roof group beyond the orange roofs is visibly distinct. Ownership/block identity is unresolved; preserve as contextual geometry until map/project data identifies it.

3. Additional orange-roof wings frame a separate court/drive zone; do not merge all buildings into one large rectangle.

4. Paved access/parking strip along one side, with nearby small roofed structures. Screen-left is a view direction, not geographic west.

5. Tree-centred open circulation space between wings; retain gaps, routes and the mature tree.

6. Mixed woodland, scrub and patchy open land beyond the buildings; this is not uniformly manicured grass.

7. Sandy/red-earth open field beside the precinct. Its exact use/boundary is unknown; do not invent sport-court markings.

8. Unfinished/open structural frame at the far edge of the view: retain as contextual evidence with date/status uncertainty.

03 / Reconstruct the plan before detail

Main ensemble. Build separately editable wing volumes from Video 1 roof edges. Preserve the long bars, bends/returns, open courts and visible connectors. The front signed facade is a specific elevation, not a template for all blocks.

Matching the street front. Use R14 street-side parking/fence and R03/R08 signed entrance to connect ground references to the aerial precinct. Match at least three roof corners and the frontage road before assigning coordinates. Do not claim a precise aerial-to-facade match without these checks.

Internal courts. Video 2 shows a broad court with basketball slab and gravel; Video 3/R16 show paved court views between residential wings. Establish whether views belong to the same connected court or adjacent courts using roof corners, vents and access routes; do not force a single court.

Distinct contextual roofs. Pink-roof rear group and unfinished frame visible in Video 1 must be separate from the confirmed orange-roof hostel assets. Name them only if the game/map data resolves affiliation.

Scale. Use project/geospatial data first and register M1/M2 using roads, roof groups and courtyard. Doors, cars and storey tiers provide relative checks, not an exact survey. Panorama/drone perspective is unsuitable for direct pixel-to-metre measurement.

Height variation. R03/R08 main frontage clearly reads ground plus three upper tiers. Some internal gallery/stair elevations appear taller. Resolve each wing independently from R04 and Video 2; never enforce one height on the entire complex.

Acceptance. An overhead game view must preserve roof groups, open spaces, frontage strip and approach routes. At road level, the signed main entrance and gate must align with that same plan.

ANNOTATED EVIDENCE PLATE

04 / Principal entrance elevation

1. Raised pale pediment with arched recess, blue EVANDY lettering and smaller flanking wording as legible in the original. Copy verified text rather than inventing block names.

2. Tall central stair/entrance bay: paired pale columns/piers, stacked gold/yellow-framed glass bands and selected outward-opening awning panes.

3. Front residential wings show inset balcony bays, dark metal patterned railings, narrow windows and shaded upper scalloped/arched eave detail.

4. Light cream walls with slightly warmer trim, deep window/balcony recesses and restrained surface ageing. Do not use bright white hospital materials globally.

5. Ground entrance is recessed behind columns, with a visible MAIN BLOCK sign, small plants and shallow entry threshold. Keep a usable approach.

05 / Main block volume and height

Confirmed frontage. R03/R08 and P03 establish the principal frontage: a central signed vertical bay between long residential wings, ground-level rooms/entry and three upper balcony/window tiers. Decorative roof/pediment height is additional to those occupied tiers.

Depth. Balconies are genuine recesses/projections with sidewalls, floor slabs and railing edges. Flat black rectangles on cream walls will not reproduce the facade at cycling distance.

Entrance rhythm. Maintain the relative width of the central bay, narrow flanking window columns and wider balcony modules. Upper central glass bands have yellow/gold mullions and some awning panels angled outward; lower entrance glazing is different.

Roofline. Terracotta-red tiled pitched roof, shallow overhang, gutters/downpipes where visible and small projecting gables over selected bays. Do not add a gable above every window or a uniform flat roof.

Pediment. Use the real peaked outer profile with the inner arch/recess and blue lettering. It is not a semicircular freestanding arch or an oversized billboard. Keep it attached to the entrance bay.

Other wings. Internal elevations in R04/Video 2 include open corridor/gallery bays and a taller-looking stair end. Count those occupied tiers separately; do not copy the four-tier frontage mechanically onto them.

Acceptance. Compare R08 head-on and R03 oblique, plus P03 for alignment. The entrance bay, occupied tiers, recess depth and roof/pediment proportions must agree simultaneously.

06 / Windows, balconies and railings

1. Central glazing uses gold/yellow frames and projecting awning panes. Use a repeated pane grid with selected open angles; these are glass windows, not wooden shutters.

2. Balconies have pale solid lower/side surfaces with dark metal railing inserts, deep shade and room glazing behind them. Preserve pattern, depth and correct tiers.

3. Terracotta tile rows, roof junctions, soffit/gutter and the selected arched/scalloped eave treatment create the silhouette.

4. Pale low boundary wall and square posts support metal vertical-bar fence panels with pointed tops. Keep this separate from balcony railing geometry.

07 / Roofs and facade module rules

Roof topology. Video 1 shows multiple roof ridges, hipped ends, gables and turns. Model each slope/hip/valley consistently with the wing plan. Do not produce one large roof covering open courts.

Roof material. Primary hostel roofs are orange/terracotta-red with a weathered tiled/ribbed appearance. Neighbouring pale pink roof groups stay different. Use normal/roughness textures for tile rows instead of one mesh per tile.

Wall palette. Light cream/off-white walls, slightly warmer beige/yellow piers and selected strong ochre vertical strips. Video 3 confirms some accents are yellow/ochre; do not recolour every column saturated yellow.

Facade variants. Use separate modules for front recessed balconies, open gallery/corridor elevations, narrow windows, stair glazing, plain returning wings and red perforated-brick ventilation panels.

Railings. Dark/light gold metal depending on elevation, rectangular frames and repeated diagonal/loop-like motifs where visible. Keep balconies and commercial upper gallery railings distinct from fence pickets.

Pipes and equipment. Add visible downpipes, wall service conduits and occasional rooftop tanks/services at their source-supported positions. Do not copy temporary scaffolding into permanent architecture.

Texture rule. Fine seams, tile ridges and distant railing details can use textures; entrance depth, balcony recesses, columns, gables and visible stairs need geometry. Repetition should retain irregular exceptions shown by the references.

08 / Internal gallery and stair ends

R04 corroborates Video 2 at 11.50/23.50 s. The exact wing name/footprint is unresolved; use matching ventilation corner and roof end to place it in the aerial ensemble.

1. Projecting stair/gallery end has stacked small balconies/open landings and its own pitched roof/gable. Confirm its occupied tiers independently.

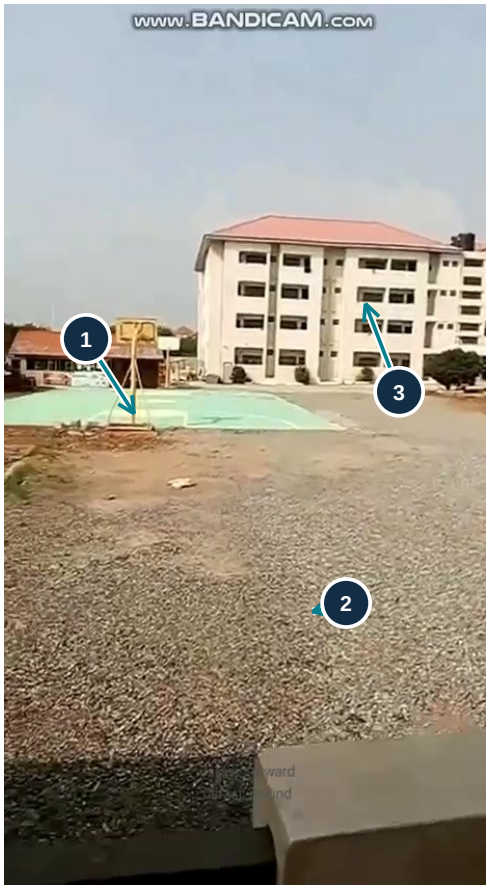

2. Tall corner has reddish perforated brick ventilation panels between pale vertical piers. These are not solid painted red rectangles or ordinary glass windows.

3. Repeated open corridor/gallery bays have deeper shadow and horizontal rails. Some ground openings are larger; preserve the variation.

4. Grey coarse gravel meets brown/tan circular-pattern hardscape and isolated red-earth areas. Keep these different surfaces, with continuous collision beneath them.

09 / Basketball court and ground

V2-05 / 21.16 s. Exact court dimensions and full painted line layout are not legible. Model the observed slab and hoop provisionally; do not invent a complete surveyed basketball layout.

1. Green/turquoise basketball slab and a hoop/backboard are visible in Video 2. Keep it within the open internal court, not on the street frontage.

2. Broad grey gravel/textured court surface surrounds the green slab. Its edge transitions to paved/red-earth zones in later Video 2 views.

3. Opposite cream residential wing with repeated open window/balcony tiers and a pale reddish roof; use it as a camera/scale anchor.

10 / Courts, stairs and opposing wings

Video 2 topology. Early and mid-clip views show the green court, gallery end, gravel and foreground stair/balcony railing. Later views turn toward a vent-panel corner and the circular-paved lane/bus area. Preserve this connected circulation evidence.

Video 3 topology. Close views show ochre vertical strips, front/inner balcony modules, a plainer opposing wing and small low buildings at the end of the court. Match these against R16 and the aerial before merging with the Video 2 court.

Stair railings. Video 2 foreground gives dark metal diagonal/rectangular motifs, cream structural columns and visible steps/landings. These belong to a local access/stair zone, not a decorative fence across the courtyard.

Temporary scaffolding. Video 3 contains diagonal metal scaffold-like members alongside a vertical bay. Their permanence is not established. Omit from the finished architectural baseline unless project scope specifically reproduces that dated condition.

Plain wing. R16/Video 3 show a less ornamented rectangular block with rows of ordinary windows, fewer balcony/gable features and a separate entrance. Do not decorate it with the main EVANDY pediment.

Surface ageing. Cracks, patch repairs and soil/gravel boundaries appear in these courts. Use roughness/colour masks for ageing; do not introduce actual deep holes or unrideable collider gaps.

Acceptance. Courts remain open, access paths connect, stair railings sit at real edges and the hoop is within the correct court. Opposing wing and ornamental wings remain architecturally distinct.

ANNOTATED EVIDENCE PLATE

11 / Circular paving and frontage

1. Signature paving consists of many large grey/beige circular discs or circular-pattern units with reddish/tan material between them. Reproduce this appearance without claiming a verified paving product.

2. Low white-edged oval/rounded planting island contains dense low shrubs and spiky ornamental plants; it is separate from parking/driving routes.

3. Small cream guardhouse has a red hipped tiled roof, dark openings and shallow entry steps/pad.

4. Pale wall and metal fence border the dark asphalt street; mature trees and red-earth roadside land lie outside.

5. Small roofed notice/display shelter by the fence, with a thin light frame, weathered roof and notice board. Treat as a separate ancillary structure.

12 / Pavement and colour specification

Front court paving. Use large slightly irregular grey/beige circular-pattern units in tan/reddish joint background, surface wear and slight local colour variation. R06/R11/P03/V2-09 corroborate it. Do not replace it with a small rectangular herringbone texture.

Road. External road is dark asphalt, bordered by red-earth/gravel verges and selected pale/tan walkway sections. Preserve fence/entrance setbacks; no paving pattern painted over the entire street.

Internal surfaces. Grey aggregate/gravel court, green/turquoise basketball slab, circular paving and red soil patches are distinct. R04 and Video 2 show transitions; keep continuous collision at every boundary.

Entry steps. Main entry has shallow thresholds; low commercial block and gatehouse have small step/pad differences. Use actual source-supported steps and gameplay access decisions, not tall random kerbs.

Material calibration. Reference photos and video differ in sun, exposure and processing. Use neutral daylight and repeated evidence for colour; avoid copying warm sunlight as yellow paint or shaded glass as matte black.

Weathering. Add restrained wall-base dirt, paving cracks, worn joint fill and gravel/red-soil variation. Keep texture scale consistent with cars and doors. Cosmetic cracks must not become geometry trenches.

Acceptance. At bicycle level the circular paving is immediately recognisable; in overhead views, its regions remain different from grey court, asphalt, green slab and soil.

ANNOTATED EVIDENCE PLATE

13 / Gate and roadside approach

1. Small gatehouse is pale cream with a red/orange tiled hipped roof and modest dark door/window openings. It is a separate low building.

2. Metal swing gate and vertical-bar fence between pale square posts/low walls. Retain actual opening width and gate-to-road relationship.

3. Curved/angled pale entrance wall and circular paving join the exterior walkway/road without a fabricated pit.

4. Main signed frontage is behind the gate; use this sightline to match entrance placement, not to place the gate directly against the hostel wall.

14 / Panorama and small structures

Panorama use. P01-P06 sweep across the frontage, main block, low ancillary/side building, gatehouse and notice shelter. Use their overlap for object order and appearance. The panorama bends walls/ground and changes perspective: do not model that curvature.

Front order. P01/P03 establish the parking strip and principal entrance beyond the fence. P04/P05 show a lower pale structure with a mostly plain side/gable, then the gatehouse. P06 isolates gatehouse, fence and roofed notice shelter.

Low side block. Keep the small plain building from P04/P05/R11 as a separate mass with its own roof and location pending alignment. It is not another four-storey residential wing.

Notice shelter. Thin posts/frame, shallow weathered/sloping roof, display board and bins/objects underneath. Do not turn this into an opaque solid shed or a second gatehouse.

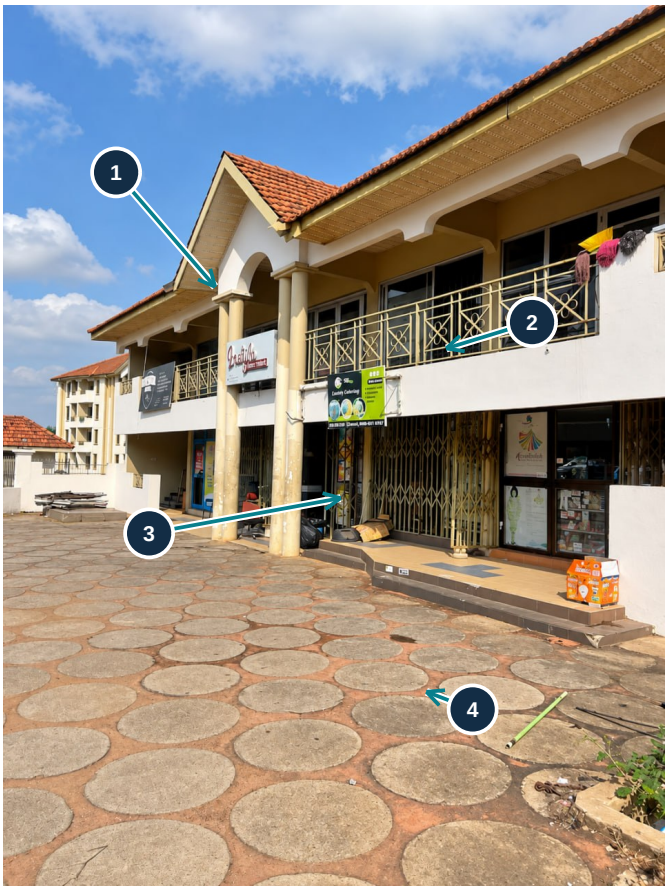

Perimeter. Pale masonry plinth, square posts and metal vertical bars/pickets. Panorama deformation and foreground parked cars obscure some spans; cross-check R17/R18 before tracing exact fence length.

Uncertainty. Gatehouse/notice board identity is clear; exact site coordinates and small-building dimensions are not. Avoid inventing functions, unseen facade windows or shop names from obscured text.

Acceptance. Match R11 overhead-ish ground view with P05/P06 street-level context. The same gatehouse, shelter and fence line must appear in both.

ANNOTATED EVIDENCE PLATE

15 / Low commercial frontage

1. Two-storey commercial/amenity block with central gabled arch, warm cream/yellow columns and red pitched tiled roof. Different scale from the residential wings.

2. Open upper gallery has light gold decorative metal railings, horizontal beams and room/shop glazing behind. Preserve the open depth.

3. Ground shopfronts have glazed doors/display areas and metal security grilles, with raised thresholds. Keep the continuous sheltered frontage.

4. Circular paving extends along the shops, with small step edges and objects. Select permanent architectural features; do not make every advertisement, crate or clothes item mandatory.

16 / Landscaping and wider environs

Front islands. Rounded/oval low pale kerbs enclose clipped shrubs, small palms/spiky ornamentals and some flowers. Use R11/R14 for shape and placement; these are small islands, not an all-grass forecourt.

Front planting strips. Short shrubs occur below windows and beside entrances; larger mature trees stand outside the fence and in some internal spaces. Preserve main sightlines to the entrance and avoid blocking parking.

Aerial context. Mixed green/brown scrubland, mature woodland and an open red/sandy field surround the hostel groups. Retain patchy vegetation and bare soil, not uniformly vivid turf.

Court tree. Video 1 shows a mature tree between building groups. It is a useful layout landmark; keep its position relative to roofs and drives after aerial registration.

Bush efficiency. One low-poly volumetric mesh per continuous low bush patch or cullable chunk, shared foliage textures, modest variation. Preserve landmark trees separately. Do not fill hedge banks with numerous full tree assets.

Adjacent groups. Pale pink-roof structures and an unfinished skeletal building beyond the confirmed hostel wings have uncertain ownership/status. Retain separate contextual placeholders or supported geometry; do not label them as Evandy blocks without project evidence.

Time differences. Videos/photos may record different stages, clothing, cars, soil and construction. Permanent geometry wins over transient objects; never pretend the combined references are one contemporaneous survey.

17 / Real lettering and site identity

Main pediment. R08/P03 show blue EVANDY lettering on the pale peaked/arched entrance pediment. Smaller flanking text should be copied only as verified in the source image; do not reconstruct blurred letters from memory.

Main Block. R08 shows MAIN BLOCK above the entrance. Attach a small sign to the actual entrance face at the observed height and scale; avoid a giant floating label.

Gate sign. R02/R15 show a freestanding blue/white EVANDY HOSTEL sign near the entrance. Preserve the sign slab/base and its position relative to gatehouse; exact typography can be matched from the clearest source.

Other blocks. No reliable full block-name list is supplied. Use neutral internal identifiers in the code/review checklist; do not invent named halls, wings or departments on physical facades.

Commercial signs. R06 includes shop advertising but some text is unclear. Reproduce general sign placement and scale; copy only readable text if needed, or use a neutral non-branded placeholder marked as an approximation.

3D implementation. Use thin extruded letters or sharp facade-attached panels/decals with small anti-z-fighting offset. Do not make text face the camera as a permanent billboard when the real text is attached to a wall.

Screen text. Bandicam, location captions, player controls, usernames/date overlays and aerial watermarks are source overlays. Never copy them into game signage or remove source detail by inventing replacement pixels.

18 / Audit current game before editing

Updated baseline. M1 now supplies a flat game map and M2 a real-world satellite plan. Use them for layout comparison, then inspect the actual 3D game for Evandy objects, transforms, heights, materials and colliders. Capture before views to establish unshown 3D errors.

Layout audit. Check if multiple wings/courts have become one box; if court gaps were filled; if gate or low commercial block is missing; if nearby roofs were merged; and if roof-plane orientation disagrees with Video 1. These are checks, not confirmed defects.

Facade audit. Check occupied tiers by wing, balcony recesses, railings, ochre strips, awning glazing, red ventilation-brick panels, eaves and principal pediment. Replace generic campus materials only where they fail Evandy evidence.

Ground audit. Check signature circular paving, gravel/green court, soil transitions, planting islands, road/verge/fence relation and entry turning space. Audit physics separately from visual appearance.

Reference registration. Use M1 game and M2 satellite to align road junctions, roof groups and central court, with existing project geospatial placement where available; then solve source cameras with three shared corners/landmarks. Exact metric scale and north remain unresolved by the upload.

Record uncertainty. Maintain a table of supported, inferred and unresolved items: rear identity, exact internal court adjacency, height of some wings, obscure sign text and hidden elevations. Never hide these by fabricating detail.

Correction reporting. For each verified game mismatch, record current behaviour/appearance, target reference, geometry/material fix, acceptance view and test result. This makes the real change reviewable.

19 / Implementation and collision rules

Build sequence. Register precinct and roads; model separate wing envelopes/court gaps; set height per wing; add roof planes; add facade variants/entrances; lay ground materials; add low structures/fence/landscape; then detail and optimise.

Keep scope local. Rebuild Evandy and visible environs without shifting unrelated campus objects or undoing UGMC/Noguchi work. Use the current coordinate system and reusable game architecture.

Bicycle travel. Provide continuous surfaces through gate, frontage lane, confirmed internal routes and permitted court paths. No invisible collision walls, lawn holes, gravel gaps, floating paving or columns in vehicle routes.

Steps and balconies. Ground entrances/steps should follow gameplay access decisions. Balcony/stair geometry must have safe local colliders where reachable, with real edge railings; do not model a railing collider across open driving areas.

Paving method. Use a texture or low-cost repeat material for circular units, with shallow visual displacement/normal detail. Do not build thousands of separate circular collision objects.

Repeat modules. Instance balcony rails, windows, vents, fence panels, roof texture detail and lights. Keep separate landmark modules for pediment, gatehouse, commercial arch and stair ends.

Performance validation. Measure draw calls, triangles and representative frame time before/after. Use levels of detail and spatial culling while preserving nearby architectural depth and sign readability. Do not promise performance gains without profiling.

20 / Acceptance cameras and checks

Aerial. Match Video 1 at 1.84, 9.84 and 18.00 s: roof groups, wing separations, courts, trees and surrounding land agree as the camera changes. Perspective match is approximate until camera/scale registration is solved.

Main frontage. Match R08 and P03 for main entrance symmetry/proportions, four occupied frontage tiers, balcony rhythm, glass bands and EVANDY pediment. Match R03 for oblique depth and roof silhouette.

Internal elevations. Match R04 and Video 2 at 11.50/23.50 s for gallery bays, stair/vent end and ground surfaces. Match Video 3 at 6.24/7.44 s and R16 for the different facing wings.

Entry/perimeter. Match R18 and R11 plus P05/P06 for gatehouse, fence, notice shelter, paving and street/verge relationship. Gate opens to the actual forecourt, not a decorative dead end.

Low commercial block. Match R06 and R13 for roof/arch/columns, open upper gallery and ground shopfronts. This block must remain lower than the main residential wings.

Ride checks. Ride the street approach, gate, front paved lane, each confirmed courtyard link and green-court perimeter where permitted. Check steps/kerbs, gravel transitions, plant islands and parking clearances.

Completion report. Provide before/after matching views, changed objects/files, a feature checklist, collision results and measured performance where available. Report unresolved dimensions/identities; a single distant screenshot is insufficient.

21 / Claude prompt: buildings and plan

Task. Rebuild Evandy Hostel and its visible environs in the existing LEGONRUSH bicycle game using this PDF, M1 game map, M2 satellite map and the 38 selected photo/video references. Inspect code, current 3D scene and existing map/geospatial data. Implement the supported corrections, not just a narrative plan.

Evidence. Use Video 1 chronological aerial snapshots for precinct topology, Videos 2/3 for internal elevations/courts, R-series photographs for main frontage/details/gates/commercial block and P-series for overlapping frontage context. M1 is a flat game map and M2 is a satellite plan; use them to establish layout differences, and inspect the live 3D scene for height, material and physics defects.

Plan. Model distinct long wings, bent/returning blocks, open courts and visible links rather than one large building. Register M1/M2 with map-left street, bottom junction, pink ring and central tree court; resolve all three orange-roof pairs, narrow links and open voids. Match gate/front street and main entrance in existing world coordinates. Treat pink-roof neighbouring group and unfinished frame as separate context with unresolved affiliation.

Heights. Main signed frontage reads ground plus three upper occupied tiers. Some internal wings appear taller; count each separately from R04/Video 2 before setting it. Do not impose one storey count or exact metre height on every wing.

Facade. Cream/off-white walls, pale/warm piers, selected ochre vertical strips, recessed/projection balcony modules with patterned metal railings, narrow windows, deep dark glass/louvre recesses and selected arched/scalloped eave bays. Add open gallery variants and red perforated ventilation-brick panels at confirmed ends.

Main entrance. Recreate the pale peaked pediment with arched recess and blue EVANDY lettering, paired tall piers, stacked yellow/gold glazing/awning panes, recessed ground entry and verified MAIN BLOCK sign. Do not apply this entrance module to all wings.

Roofs. Terracotta-red tiled pitched planes, hips, ridges, valleys, small selected gables and eave overhangs. Keep court voids open and neighbour roof tones separate. Use texture/normal maps for fine tiles, geometry for roof silhouette and balcony depth.

22 / Claude prompt: grounds and details

Paving. Recreate signature large grey/beige circular-pattern units in tan/reddish joint/background material along the front and selected internal lanes. Keep dark asphalt road, grey gravel court, red soil, pale thresholds and green/turquoise basketball slab distinct.

Courts. Video 2 provides basketball slab/hoop, broad gravel and gallery/stair-end views; Video 3/R16 provide paved court and plain opposing wing. Match shared landmarks before deciding their exact adjacency. Keep all confirmed passage gaps and usable routes.

Gate and fence. Small cream gatehouse with red hipped tile roof, metal swing gate, pale posts/low wall and metal picket panels; small roofed notice shelter, low plain side structure and observed gate sign. Match R11/R18/P05/P06.

Commercial block. Separate low two-storey cream amenity/shop block with red roof, central gabled arch, warm round columns, open upper gallery with gold/light decorative railing and ground shopfront glazing/security grilles. Match R06/R13; exact unclear shop names remain unspecified.

Vegetation. Rounded pale-edged ornamental islands, clipped shrubs, spiky plants, selected mature courtyard/road trees and mixed scrub/woodland/open red-earth surroundings. Use low-poly volumetric bush meshes per patch/chunk with shared textures; landmark trees remain separate.

Source artefacts. Do not copy Bandicam, watermarks, captions, usernames, video controls, panorama distortion or temporary scaffold-like members into permanent architecture. Use multiple references for ambiguous details; do not generate nonexistent source pixels.

Signs. Attach verified lettering/panels to real surfaces with accurate scale. Use internal neutral IDs for unlabelled blocks. No invented block names, affiliation or metre dimensions.

23 / Claude prompt: verify and deliver

Implementation. Scope changes to Evandy and immediate supported environs. Preserve world placement and unrelated campus work. Build modular reproducible geometry and remove superseded overlapping objects/colliders only after replacement alignment is verified.

Physics. Continuous bicycle-supporting surfaces through permitted gate/front/court routes; shallow material boundaries; correct clearance around fences, columns, plants and parked props. Avoid invisible walls, pothole-like lawn traps and circular-paver collider seams.

Optimisation. Share materials/textures and instance repeated facade/fence components. Texture fine roofing and paving; retain near-field balcony/entrance/rail geometry. Add distance detail levels and spatial culling, then measure frame time/draw calls/triangles.

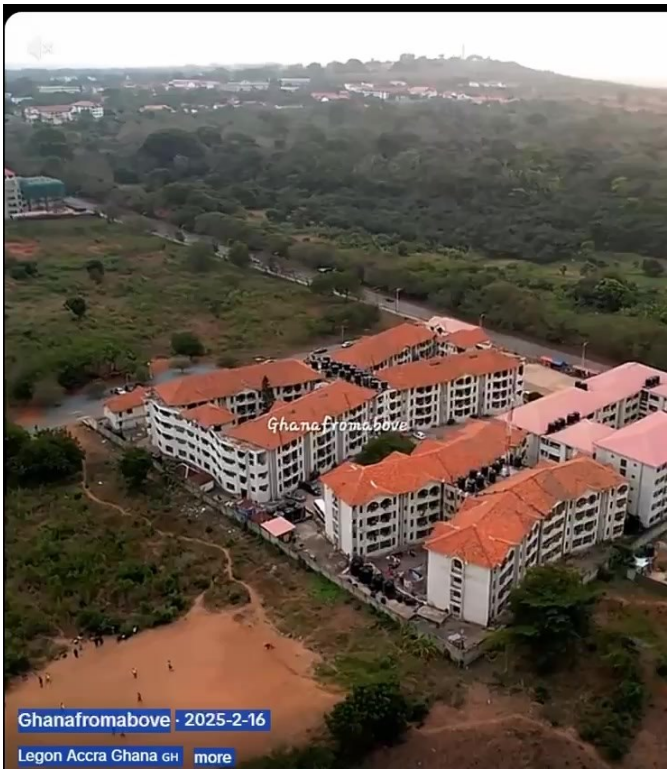

Required comparison views. Provide registered overhead comparisons to M1/M2 with numbered targets 1-11, then before/after oblique renders matching V1-01/V1-03/V1-05; R08/P03 frontage; R04/V2-03/V2-06 internal end; V3-04/V3-05 opposing wings; R11/R18/P06 gate/perimeter; R06 commercial block.

Required ride tests. Run street approach, gate, front paved lane and every confirmed permitted court link. Record problems and fixes at thresholds, gravel/paving transitions, landscaping and parked vehicles. Do not report tests that were not run.

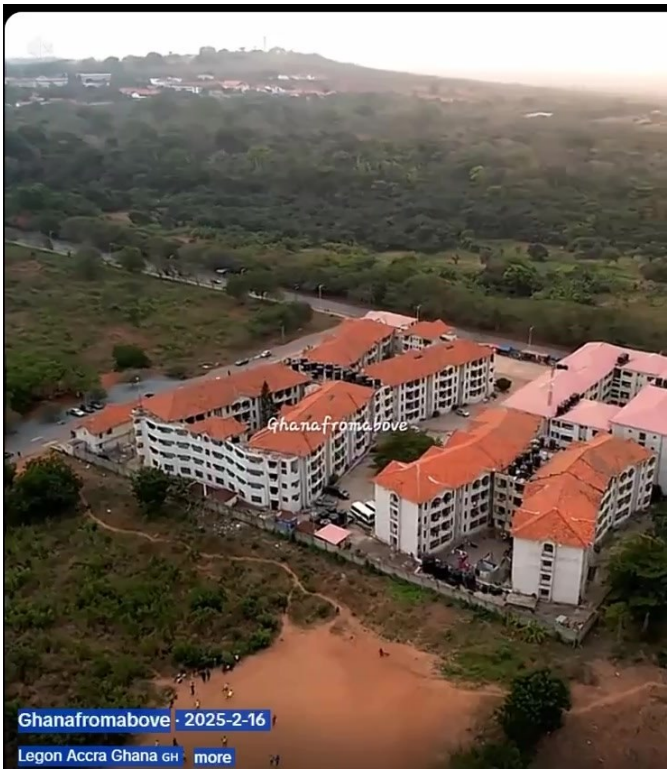

Report. List changed files/objects, major transform/height choices, materials, measured performance and a source-linked feature checklist. Separate observed target facts from inferred plan/height and unresolved rear identities.

Done means. Plan, roof silhouettes, facade tiers/depth, characteristic paving, low frontage buildings, fences and landscape agree across multiple views. Preserve uncertainty where evidence is missing; no fabricated architectural precision.

Video snapshots / 01-02

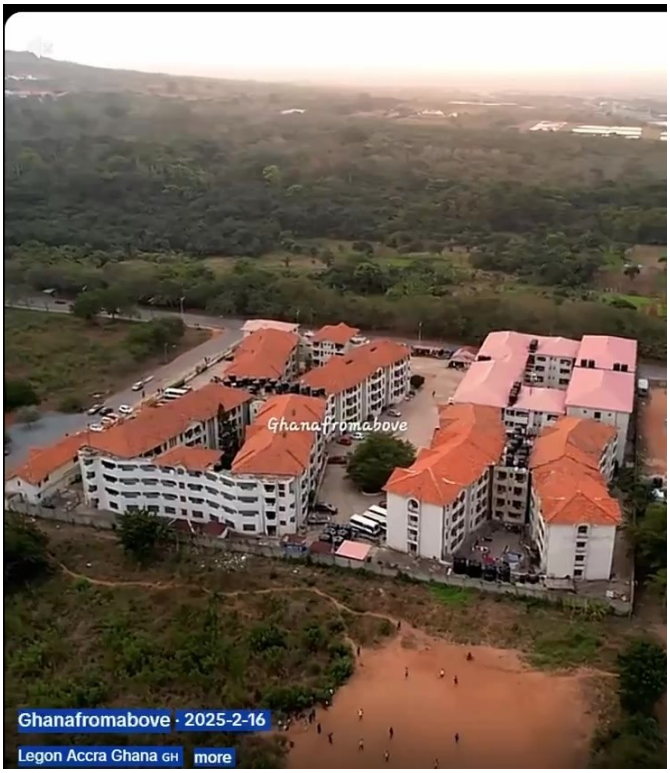

V1-01 / Video 1 / 1.84 s
Aerial early oblique: orange hostel roof groups, roadside strip and wooded context.

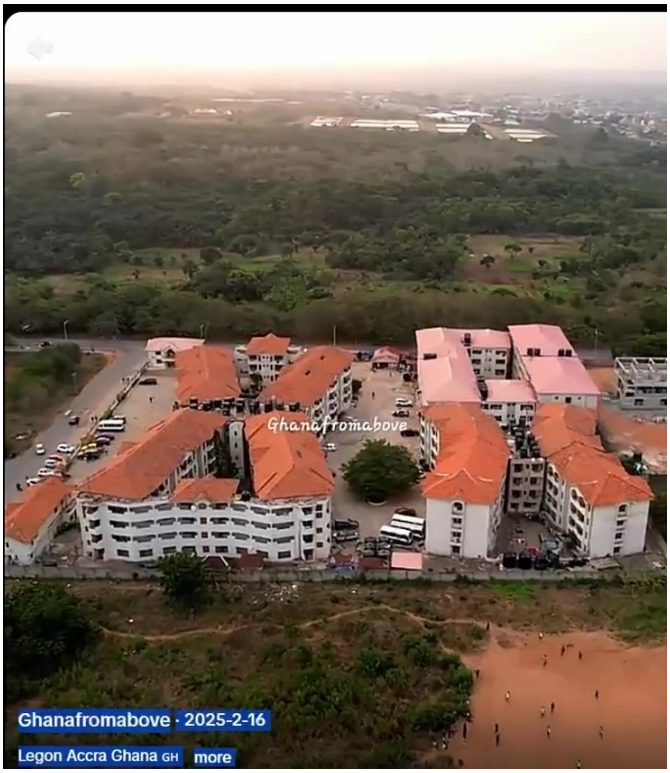

V1-02 / Video 1 / 5.84 s
Aerial orbit: separated wings/court voids, roofs and perimeter surroundings.

Video snapshots / 03-04

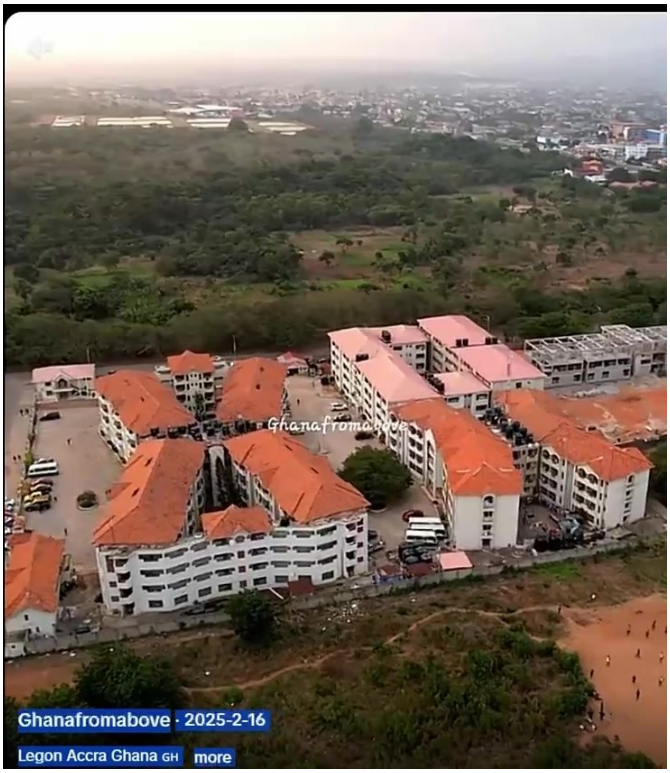

V1-03 / Video 1 / 9.84 s
Aerial middle orbit: orange groups, tree-centred court and pale pink roofs behind.

V1-04 / Video 1 / 13.84 s
Aerial later orbit: long bars/returning roofs, drives and open red-earth area.

Video snapshots / 05-06

V1-05 / Video 1 / 18.00 s
Aerial late view: roof topology, adjacent pink group and unfinished frame.

V2-01 / Video 2 / 1.56 s
Internal court: green basketball slab/hoop, grey aggregate and facing block.

Video snapshots / 07-08

V2-02 / Video 2 / 9.44 s
Projecting gallery/stair end, stacked tiers and gravel court.

V2-03 / Video 2 / 11.50 s
Open gallery wing and red perforated-brick ventilation corner.

Video snapshots / 09-10

V2-04 / Video 2 / 17.86 s
Court-facing block and green slab, with foreground railing context.

V2-05 / Video 2 / 21.16 s
Clearer basketball slab/hoop and facing wing, broad gravel court.

Video snapshots / 11-12

V2-06 / Video 2 / 23.50 s
Ventilation-brick corner with service details and red-earth/gravel boundary.

V2-07 / Video 2 / 26.34 s
Transition from internal court to circular-paved frontage lane and bus area.

Video snapshots / 13-14

V2-08 / Video 2 / 28.84 s
Circular paving, gate/fence and low end structure in frontage context.

V2-09 / Video 2 / 32.84 s
Long internal/front lane: residential elevation and circular pavement.

Video snapshots / 15-16

V3-01 / Video 3 / 0.76 s
Close balcony facade and ochre vertical bay; temporary scaffold-like members visible.

V3-02 / Video 3 / 1.56 s
Ochre vertical accent, narrow windows and adjacent balcony bays.

Video snapshots / 17-18

V3-03 / Video 3 / 4.30 s
Facade return and balcony/window rhythm; identify scaffold separately.

V3-04 / Video 3 / 6.24 s
Long residential court elevation and small low structure beyond.

Video snapshots / 19-20

V3-05 / Video 3 / 7.44 s
Open court facing a plainer residential wing.

V3-06 / Video 3 / 8.80 s
Opposing wing corner, ochre bay, parked cars and circular paving.

R02 / photo_2_2026-10-14_02-00-17.jpg
Gatehouse, sign, metal gate and hostel behind.

R03 / photo_3_2026-10-14_02-00-17.jpg
Principal facade: entrance/pediment, glazing and balcony geometry.

R04 / photo_4_2026-10-14_02-00-17.jpg
Internal gallery end, vent-brick corner, gravel and circular paving.

R05 / photo_5_2026-10-14_02-00-17.jpg
Stair glazing/awning panes, balcony railings and fence detail.

Selected stills / 05-08

R06 / photo_6_2026-10-14_02-00-17.jpg
Two-storey commercial block, gallery/arch/columns and paving.

R08 / photo_8_2026-10-14_02-00-17.jpg
Main frontage with EVANDY and MAIN BLOCK signs; four occupied tiers.

R11 / photo_11_2026-10-14_02-00-17.jpg
Gatehouse/notice shelter, fence, road and planting island.

R13 / photo_13_2026-10-14_02-00-17.jpg
Road/red-earth verge and low commercial block in frontage context.

Selected stills / 09-12

R14 / photo_14_2026-10-14_02-00-17.jpg
Elevated frontage view: parking strip, planting islands, fence and road.

R15 / photo_15_2026-10-14_02-00-17.jpg
Exterior gate approach and EVANDY HOSTEL sign.

R16 / photo_16_2026-10-14_02-00-17.jpg
Internal court with ornamental wings and plainer opposing block.

R17 / photo_17_2026-10-14_02-00-17.jpg
Street frontage behind fence: balcony/roof module repetition.

Selected stills / 13-16

R18 / photo_18_2026-10-14_02-00-17.jpg
Gatehouse, gate, entrance walls, paving and main facade sightline.

P01 / Screenshot 2026-10-14 012245.png
Frontage sweep: parking, fence, circular paving and long facade.

P03 / Screenshot 2026-10-14 012310.png
Central panorama view: principal entrance and adjacent wings.

P04 / Screenshot 2026-10-14 012320.png
Frontage return and plain low ancillary/side structure.

Selected stills / 17-18

P05 / Screenshot 2026-10-14 012330.png
Gatehouse and low side structure at frontage edge.

P06 / Screenshot 2026-10-14 012354.png
Gatehouse, small notice shelter/display board and fence.
