CLAUDE CODE IMPLEMENTATION BRIEF

Finish-Line & Destination Entrance Banners

For the existing University of Ghana bicycle exploration game

VISUAL REFERENCE

Concept examples: a race FINISH banner and destination-name banners. These are visual guidance for the in-game 3D structures, not a request to insert this collage as a flat image into the game.

NON-NEGOTIABLE DISTINCTION

Replace the oversized black pillar structures at destination entrances and race endpoints with the appropriate overhead banners. Leave the existing white pillars at race starting points unchanged.

Ready-to-paste prompt starts on the next page.

PROMPT FOR CLAUDE CODE

Task: Replace oversized black pillars with proper overhead banners

I am improving the existing University of Ghana 3D bicycle exploration game. Inspect the current codebase and implement the changes described below directly in the existing project. Do not rebuild the game or redesign unrelated parts of it.

1. Race finish points: add a functional FINISH banner

At the endpoint of races, replace the oversized black pillar structure with a proper overhead race-finish banner spanning the road or designated course path.

- Use a clearly readable FINISH label, with a racing-style checkered pattern or similarly recognisable finish-line design inspired by the attached visual reference.
- Support the banner using appropriately sized posts or a lightweight overhead frame. It must look like a real 3D structure in the campus environment, not a flat UI overlay or a billboard floating in space.
- Align the banner perpendicular to the direction of travel and place it exactly at the race endpoint. Give the bicycle and camera enough vertical and lateral clearance.
- Create or reuse a finish trigger at the correct crossing line. Crossing it in the valid direction must register the player's race completion and invoke the existing race-results logic, if present.
- The banner must not block the road, cause bicycle collisions, or be confused with the race start marker.

2. Destination entrances: use destination-name banners

At destination entrances, replace the oversized black pillar structures currently being generated with overhead destination banners across the appropriate road or entrance approach.

- Display the destination name clearly, for example “LEGON MAIN ENTRANCE” or “DEPARTMENT OF GEOGRAPHY AND RESOURCE DEVELOPMENT”. Use the actual name associated with each destination in the game data; do not hard-code one label for every location.
- Use a clean, legible signboard with suitable colours, contrast, and, where the project already has an appropriate asset, a university crest or destination emblem. Do not invent official logos if none is available in the project.
- Use proportionate support posts or columns, with realistic scale and enough clearance for the bicycle, rider, and camera. Avoid the huge thick black pillars that currently dominate the screen.
- Place each banner at the correct destination entrance based on the existing route and destination coordinates. Make the banner face approaching riders so the text can be read as they arrive.
- Destination banners are visual navigation landmarks. Keep any existing distance counter, arrival prompt, destination logic, and navigation behaviour working as before.

3. Preserve starting-point structures exactly

The existing white pillars used at race starting points are acceptable. Leave them as they are.

- Do not replace, redesign, recolour, resize, or remove the existing white starting-point pillars.
- Do not apply the destination/finish banner replacement globally to every pillar or marker. Distinguish start points, destination entrances, and race endpoints by their existing semantic role or event data.
- If the current code does not distinguish those roles clearly, make the smallest safe data/configuration change needed to identify them explicitly.

4. Visual quality and positioning

- Follow the attached reference image for the general concept: an overhead horizontal sign supported across the road, with the destination name or FINISH clearly visible.

- Build proper in-world 3D geometry and materials. Do not place the four-panel reference collage itself into the game world.
- Keep banners visually consistent across destinations while allowing the text to change. The race finish banner should be visually distinct from destination banners.
- Ensure the structure fits the campus style, perspective, and lighting, and does not obscure important buildings or road junctions more than necessary.
- Check the full approach from the rider's camera, not just a static editor view. Text should be legible as a player cycles toward the banner.
- Avoid floating signs, misaligned supports, posts inside the riding lane, clipping through nearby buildings or trees, and banner geometry that intersects the rider or camera.

5. Implementation and compatibility

- Inspect the existing destination marker, event, race endpoint, and scene/object creation logic before changing it.
- Reuse shared components or create a clean reusable banner component with configurable label, type, dimensions, materials, support geometry, and optional finish-trigger behaviour.
- Only attach finish-trigger logic to race endpoints. A destination entrance banner must not accidentally finish a race unless that destination is configured as the race endpoint.
- Preserve existing keyboard, mouse, and gamepad controls, bicycle movement, camera behaviour, speedometer, minimap, destination labels, and tour controls.
- Avoid modifying unrelated campus buildings, roads, terrain, or environment assets.

6. Validation

1. Run the existing game and inspect at least one destination entrance and one race finish point from the rider’s actual camera view.
2. Confirm the destination entrance shows its own correct name and no longer uses the oversized black pillar structure.
3. Confirm the race endpoint has a visible FINISH banner and crossing the finish line triggers the completion logic exactly once.
4. Confirm the existing white race-start pillars are unchanged.
5. Check bicycle clearance, collision behaviour, sign readability, support alignment, and appearance while approaching from the road.
6. Verify that ordinary single-player exploration, destinations, and other events continue to work as before.

ACCEPTANCE CRITERION

Destination entrances and race endpoints use appropriately sized overhead banners instead of the oversized black pillars. Race starts retain the existing white pillars. Finish banners are functional race endpoints, while destination banners preserve the existing arrival/navigation behaviour.

Implement the changes directly in the existing project, run the game, and fix any issues found. Do not merely return a plan or sample code.
