Diamond Jubilee Hostel: reconstruction brief

LEGONRUSH | Behind Jean Nelson Aka Hall
Detailed instructions for Claude based on the real video, current game recording, seven additional photos and two supplied map views.

P03: four-level hostel with a screened stair tower, pale walls, contrasting base and paved frontage.

Primary finding: the recorded game asset is a generic two-level block with oversized repeated windows and broad lawn. The real hostel has four main levels (ground plus three upper), distinctive fin-screened stairs, a separate entrance feature, varied louvred openings and a carefully divided exterior/courtyard environment.

Priorities: identify the correct scene object; register the two-courtyard footprint; rebuild height and roof massing; fix stairs, entrance and window types; restore pavers, kerbs, drains, planting and the dirt-side setting. Decoration must follow structural correction.

Includes 20 selected video frames in chronological order within each recording. Frame IDs are R01-R12 (real) and G01-G08 (game). These are view families, not synchronized or surveyed camera pairs.

Source register and evidence hierarchy

V-R: IMG_6894.MP4, 02:18.10 duration, portrait 480 x 848, 30 fps. A ground-level tour of the front/entrance, not an aerial survey. Extracted frames retain source resolution; enlarging them does not recover hidden detail. Repeated presenter segments and the end cards were excluded from the selected sequence.

V-G: bandicam 2026-10-15 01-09-17-947_exported.mp4, 00:44.14 duration, 1920 x 1080, 30 fps. A bicycle-height tour of the existing two-level game block and nearby buildings. It does not expose every roof or courtyard from above.

P01: photo_1_2026-10-15_01-15-57.jpg - Inner open courtyard: four-level walls, balcony recesses and unfinished geometric beds/paths.

P02: photo_2_2026-10-15_01-15-57.jpg - Screened stair tower and front wing; construction remnants/aggregate.

P03: photo_3_2026-10-15_01-15-57.jpg - Named stair tower, paved forecourt and lawn island.

P04: photo_4_2026-10-15_01-15-57.jpg - Open balcony/stair side, rear/service edge and rough planting.

P05: photo_5_2026-10-15_01-15-57.jpg - Long rear/outer wing, dirt access and roof tanks.

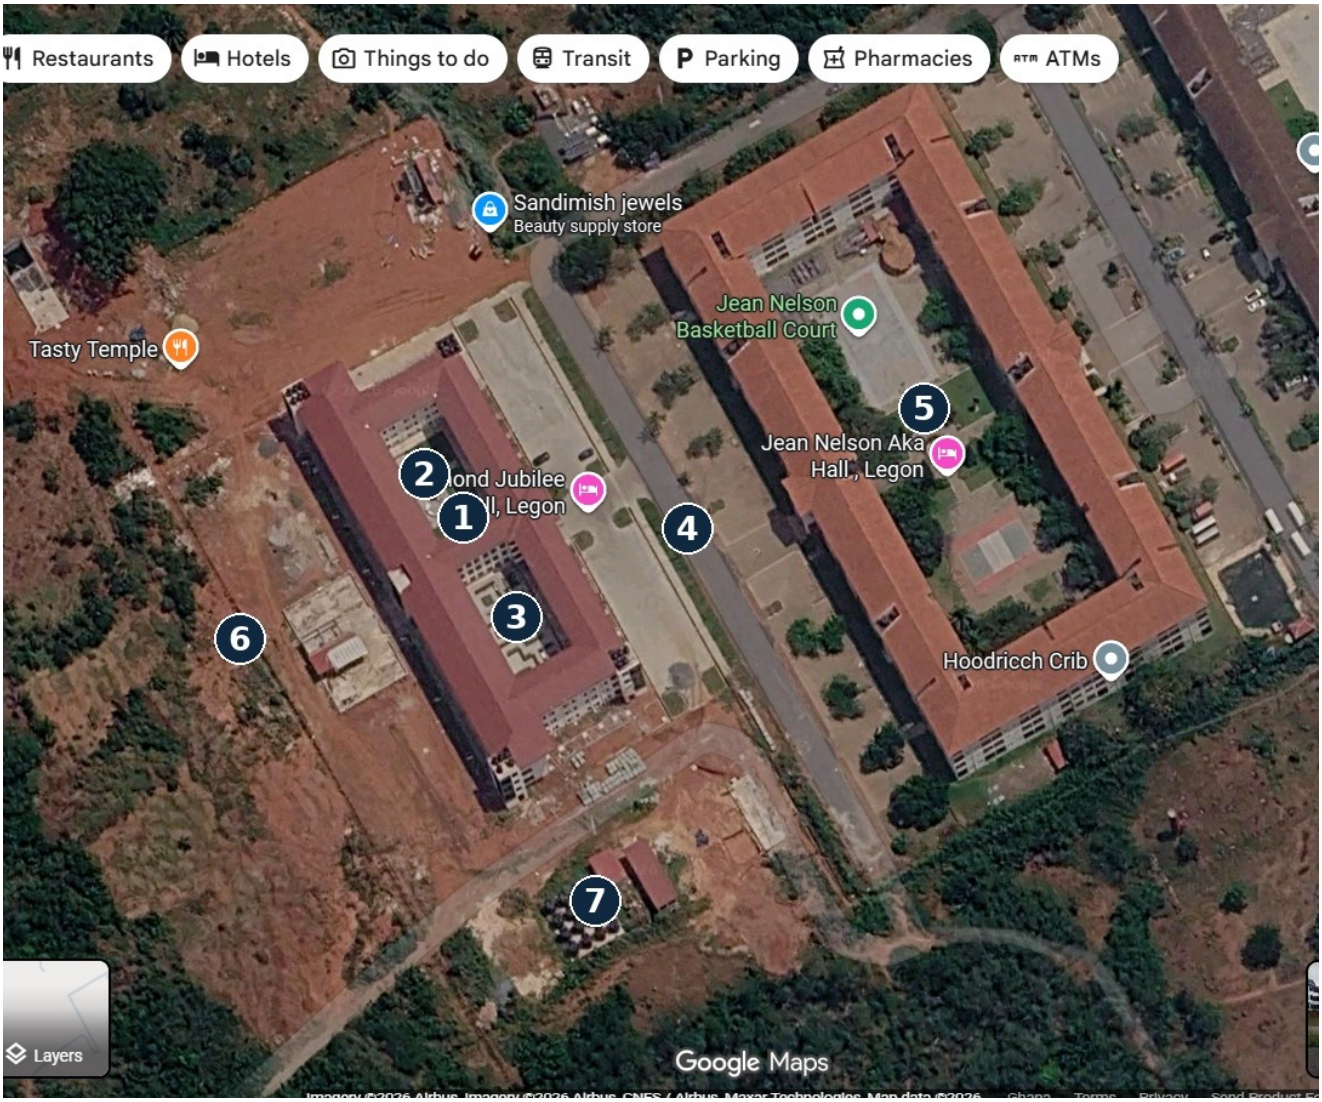

P06: photo_6_2026-10-15_01-15-57.jpg - Paved frontage, stair screen, aggregate pile and entrance farther along.

P07: photo_7_2026-10-15_01-15-57.jpg - Entrance feature, parking frontage and small lawn/kerb strip.

M01: Screenshot 2026-10-15 010524.png. Satellite layout visibly branded Google Maps; despite the message calling it Apple, this is the attachment used for real-world layout. **M02:** image(20261015-011906).png, supplied game/vector map.

Priority: map for layout; clear photos for fine architecture; video for continuity and frontage state; game recording for demonstrated mismatches. Photo/video capture dates are unverified. Separate construction-stage features from persistent geometry and do not invent unseen interiors.

M01: locate the hostel and its two courtyards

M01: numbered analysis points added to a copy of the original. Screen orientation is used; north has not been established from this crop.

1: Diamond Jubilee is the smaller elongated block at image-left of Jean Nelson. **2:** upper courtyard opening. **3:** lower courtyard opening with more visible geometric hardscape. **4:** separating road and paved frontage. **5:** Jean Nelson, a separate larger compound; preserve it.

6: rough earth/service edge outside Diamond Jubilee. **7:** detached small roof/utility-like group near the lower site edge; its precise equipment type is unresolved. Model only what can be distinguished and do not attach it as a hostel wing.

Trace the outer roof boundary and both open courts. The central cross-connection divides the courts; do not fill them with roof or cut one enormous void. Register against the separating road and Jean Nelson corners before assigning fronts/backs.

M02: retain useful topology; verify object identity

M02: smaller double-court footprint beside Jean Nelson. The marker/route does not by itself identify the correct game mesh.

The supplied vector map already suggests two openings in the small hostel footprint. This is useful coarse topology, not proof that the world mesh matches the real courtyard sizes, wing widths, orientation or height. Compare the map polygon and rendered mesh individually.

In the game recording, the route HUD says “TO DIASPORA DOME,” and a small visible building label also uses that name near the end. This is an identity warning. Confirm the recorded asset corresponds to the Diamond Jubilee footprint; do not rename or overwrite another hall solely because the route destination appears on screen.

Registration checklist: locate Diamond Jubilee and Jean Nelson scene IDs; align their long axes, road gap, frontage and courtyard pair; identify where the entrance feature and named stair tower belong; preserve neighboring hall geometry. Screen-left/right and a rotating minimap are not reliable compass directions.

No measured scale or survey coordinates are supplied. Calibrate relative dimensions from the registered layout and existing road anchors. State the basis of any metre values used in the implementation.

What the game got wrong: correction priorities

DJ-01 | Identity and footprint: Confirm the correct hostel object before editing. Preserve the two-court organization supported by M01/M02; check actual wing thickness and inter-block spacing.

DJ-02 | Height: Game G02/G03/G06 shows two main window rows. Real P01/P03/P05 shows four occupied levels. Rebuild floor elevations and overall mass rather than doubling the whole object, which would also distort windows and roof.

DJ-03 | Stair towers: Missing distinctive tall fin-screened stair cores, open side landings and visible internal stair diagonals. Do not replace these with a flat black wall or random balcony boxes.

DJ-04 | Openings: Game uses very large square white-cross windows. Real room/service openings vary: narrower louvred rectangles, slit-like companions and short horizontal slots. Preserve solid wall divisions.

DJ-05 | Entrance: Real front has a multi-level dark-glazed/grey-clad entrance feature and slim flat canopy. A generic repeated room facade is insufficient.

DJ-06 | Ground and environment: Game lawn and a narrow black strip do not reproduce the broad interlocking-paver frontage, kerbed islands, perimeter planting, drainage, rear red-earth access and scrub.

DJ-07 | Roof and color: Use the real low-profile roof/eaves, pale main walls, light beige/peach base and restrained grey details. The game’s bulky hip projections and dark brown base need evidence-based replacement.

These are evidence-backed categories, not claims that every hidden wall is known. Prioritize silhouette, openings and access over a general “visual improvement.”

Real video: selected frames 1-3

R01 | 00:03
Wide approach: named stair tower, front wing and paved/lawn boundary.

R02 | 00:10
Front corner: tower location and L-like junction of visible wings.

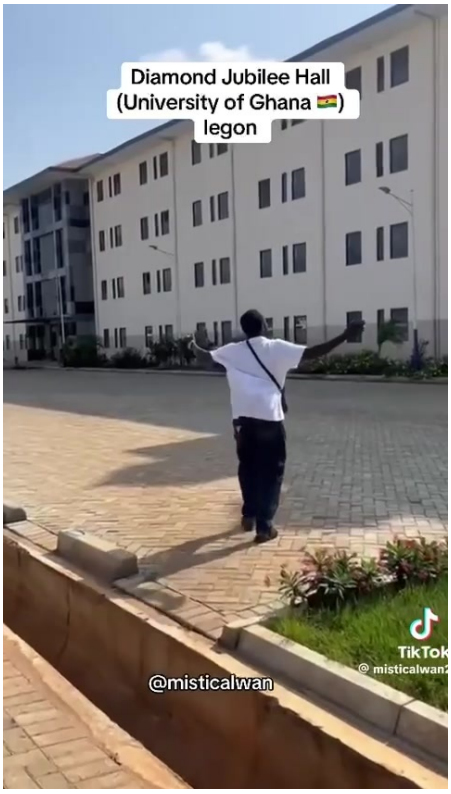

R03 | 00:20
Long frontage: four levels, mixed openings and landscape edge.

Read these as successive observations of the same hostel. Presentation/person occlusion and source overlays remain visible. Still photos provide finer detail than this 480-pixel-wide source. Use timestamps to revisit surrounding frames if an edge or opening is obscured.

Structure check: four window levels and the tall screened core establish the height target. The forecourt is a paved area with separate planted islands, not a continuous lawn.

Real video: selected frames 4-6

R04 | 00:26
Front wing with broad paved forecourt; people obscure some lower detail.

R05 | 00:30
Close tower view: vertical lettering, dark fins and internal stair flights.

R06 | 00:38
Tower/base and neighboring service slots; pale lower wall zone.

Read these as successive observations of the same hostel. Presentation/person occlusion and source overlays remain visible. Still photos provide finer detail than this 480-pixel-wide source. Use timestamps to revisit surrounding frames if an edge or opening is obscured.

Feature check: the stair screen is transparent between fins; stairs and landings can be perceived behind it. Lettering is on the pale side strip. Keep the lower solid base separate from the upper screen.

Real video: selected frames 7-9

R07 | 01:02
Main frontage: varied room openings and planting at ground level.

R08 | 01:38
Entrance approach: glazed grey feature in relation to room wing.

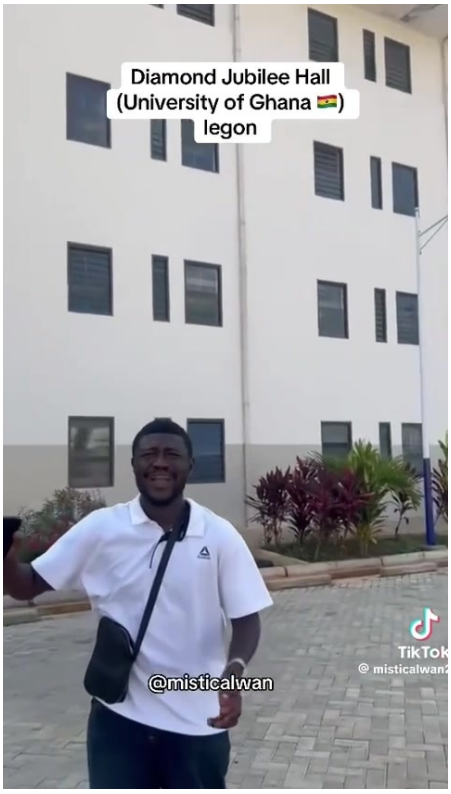

R09 | 01:42
Entrance detail: flat canopy, glazing and clear doorway zone.

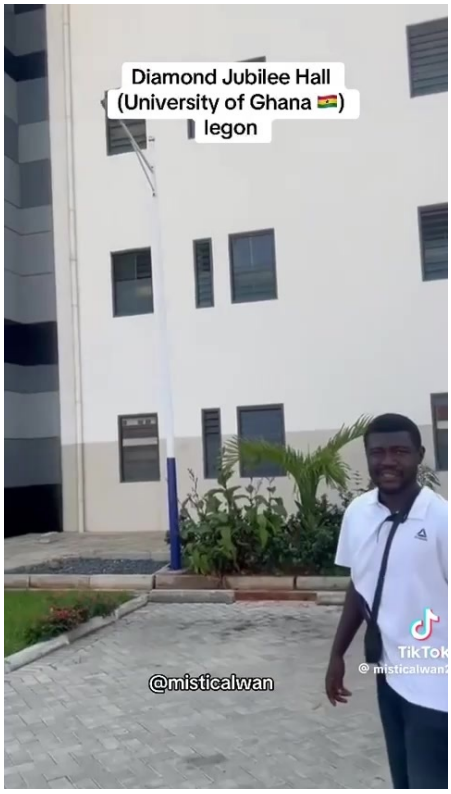

Read these as successive observations of the same hostel. Presentation/person occlusion and source overlays remain visible. Still photos provide finer detail than this 480-pixel-wide source. Use timestamps to revisit surrounding frames if an edge or opening is obscured.

Continuity check: the entrance feature belongs along the long frontage; the room windows beside it retain their narrow/wide pattern. Do not duplicate the entrance at both end towers.

Real video: selected frames 10-12

R10 | 01:54
Room-wall detail: narrow/wide opening rhythm and planting.

R11 | 02:02
Solid facade and landscape edge near entrance; do not invent a doorway.

R12 | 02:09
Entrance context, curved lawn island, kerb and red hydrant-like object.

Read these as successive observations of the same hostel. Presentation/person occlusion and source overlays remain visible. Still photos provide finer detail than this 480-pixel-wide source. Use timestamps to revisit surrounding frames if an edge or opening is obscured.

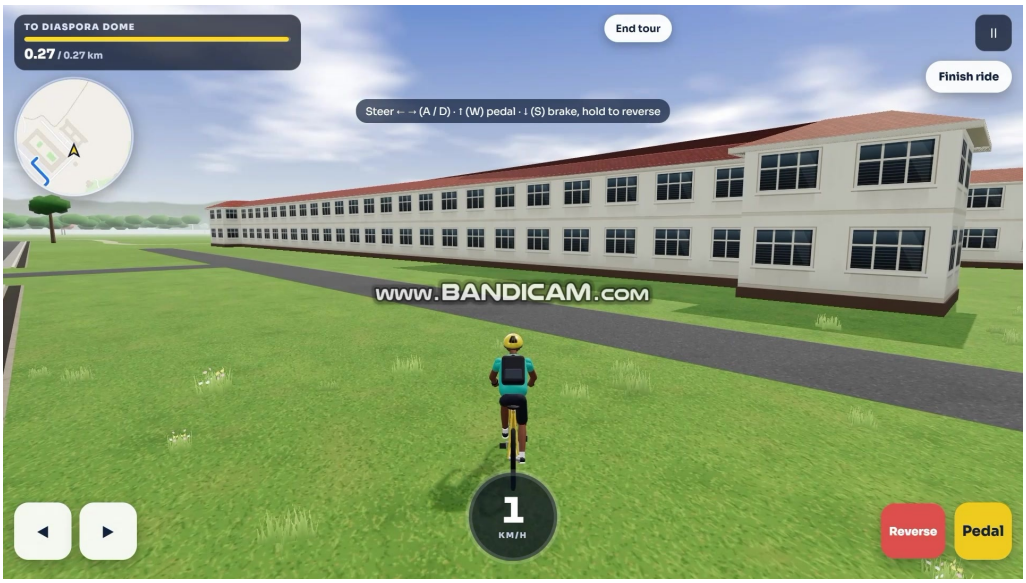

Ground check: restore kerbs, paver texture, planting edge and frontage objects at supported positions. The presenter and moving vehicles are not dimensions or permanent site features.

Game video: selected frames 1-2

G01 | 00:01 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G01: distant two-level block across road/lawn; verify identity using M01/M02.

G02 | 00:05 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G02: oversized square windows, two levels, dark base and black frontage strip.

No exact real/game camera match is claimed. Register the footprint and feature orientation before making a side-specific change. Neighboring buildings appearing in the recording are context, not automatic correction targets.

Game video: selected frames 3-4

G03 | 00:13 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G03: projecting square corner with repeated windows; missing screened tower identity.

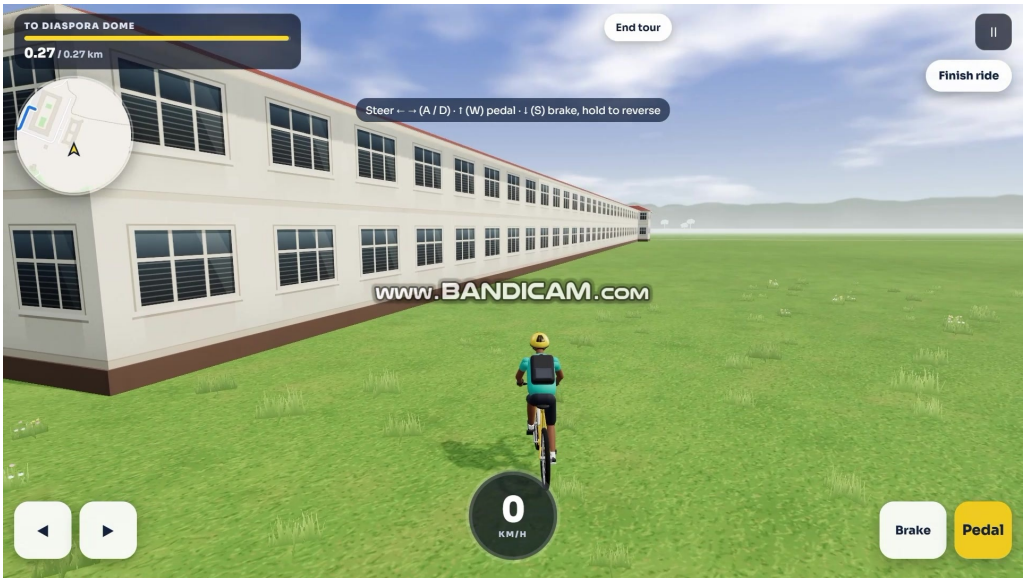

G04 | 00:16 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G04: long facade remains a generic two-row room pattern.

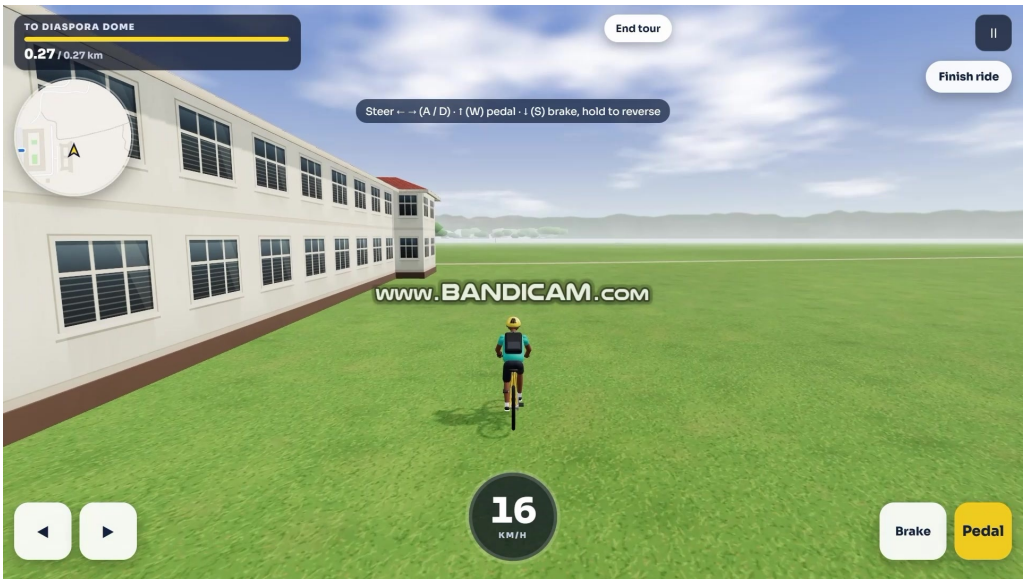

No exact real/game camera match is claimed. Register the footprint and feature orientation before making a side-specific change. Neighboring buildings appearing in the recording are context, not automatic correction targets.

Game video: selected frames 5-6

G05 | 00:25 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G05: side/rear view; no convincing rough-earth service edge or differentiated opening types.

G06 | 00:35 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G06: continued two-level wing in broad lawn; rear site lacks real mixed ground cover.

No exact real/game camera match is claimed. Register the footprint and feature orientation before making a side-specific change. Neighboring buildings appearing in the recording are context, not automatic correction targets.

Game video: selected frames 7-8

G07 | 00:40 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G07: nearby larger block enters view. Keep neighboring assets distinct.

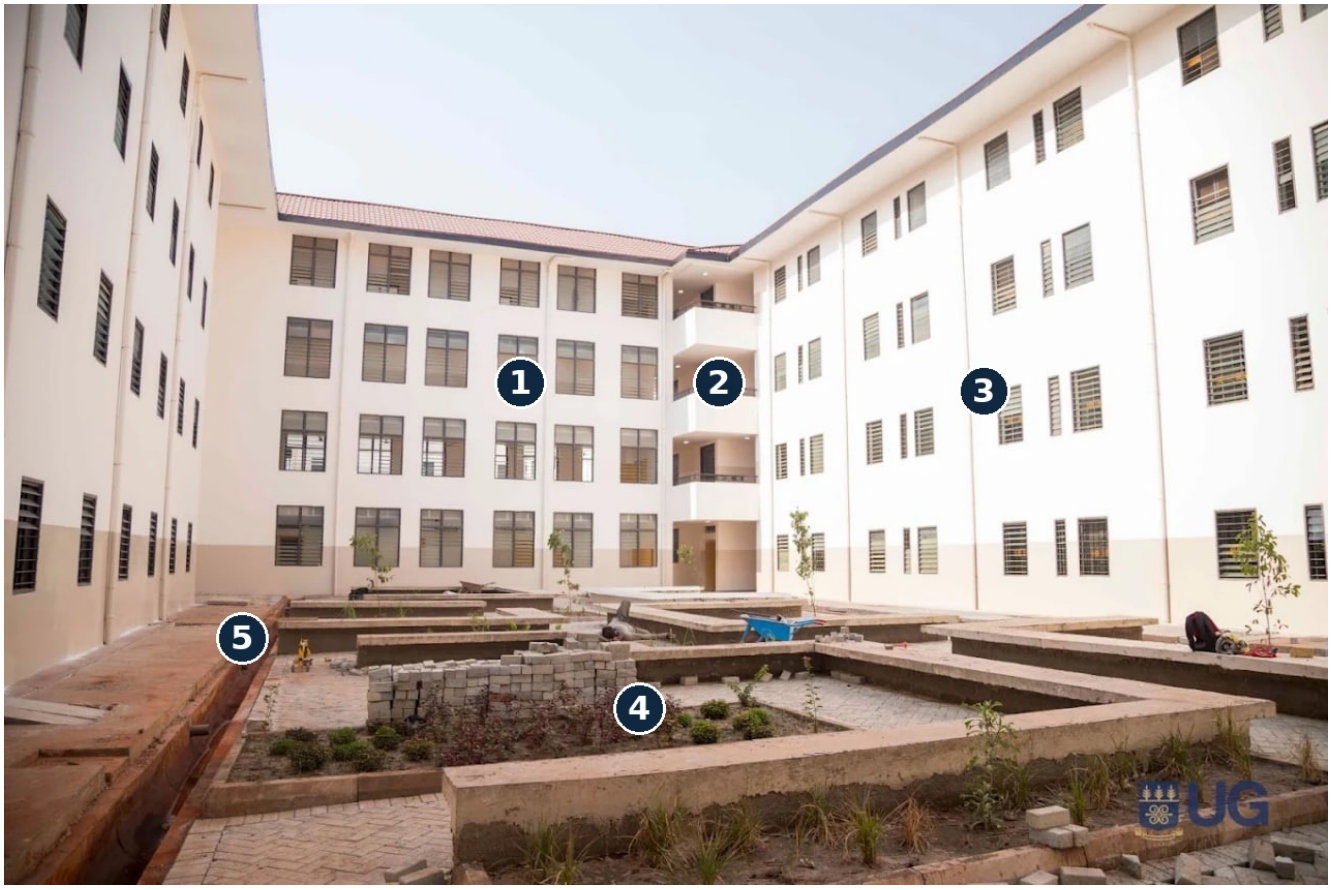

G08 | 00:43 | bandicam 2026-10-15 01-09-17-947_exported.mp4

G08: label/route context requires identity check; do not treat the larger hall as the target.

No exact real/game camera match is claimed. Register the footprint and feature orientation before making a side-specific change. Neighboring buildings appearing in the recording are context, not automatic correction targets.

P01: courtyard structure and interior-facing walls

P01: an open internal courtyard, not a room-interior plan. This is the strongest supplied interior-facing reference.

1. Far wall: four visible rows of broad louvred window openings; approximately six broad bays per row are distinguishable on the unobstructed end wall. Count and confirm each from the original; exclude the adjacent balcony recess from this count.

2. Corner balconies/landings: stacked open recesses with pale parapets/edges and dark railing detail. They have real void depth. Do not replace them with windows, solid cream panels or random external pillars.

3. Side walls: narrower openings, slit companions and broad wall piers differ from the far wall. Do not copy one facade grid around the courtyard.

4. Ground: low geometric concrete/stone-edged beds and paved paths, with construction materials still present. Not a flat grass court, pool or fountain. **5. Perimeter:** narrow walkway and drainage-like recess; retain clear circulation along the wall.

P02-P03: the screened stair tower is a defining feature

P02: stair flights are visible behind closely spaced dark vertical fins. Scaffold/aggregate indicates a construction-stage photograph.

P03: clearer named tower with the “DIAMOND / JUBILEE HALL” lettering and stylized 75 emblem.

Build a pale tower frame, a set-back screen plane, real vertical fin gaps, visible landings/stair diagonals and side openings. The screen wraps the corner in P02; its two faces must be reconciled with the plan. The lower portion is mainly solid pale base; the screen should not continue blindly into the ground.

The adjacent main wing is four levels. Roof-mounted black cylindrical tanks sit above the stair/service cores; their supporting roof extension is not a fifth residential level. Count tank groups from the best visible views rather than cloning tanks onto every roof bay.

P04-P05: side/rear architecture and red-earth setting

P04: stacked open landing recesses, a broad unbroken cream wall pier, roof overhang and rough planted/service edge.

P05: four-level long wing, screened end and substantial red-earth access area.

The rear is not an all-asphalt frontage or manicured lawn. Preserve the broad compacted red/tan earth area, rough grass and tracks. Window spacing differs from the game's large white-cross grid. Leave solid piers solid; do not populate all wall area with openings.

P04 also shows loose blocks and works in progress. Use them as construction-phase evidence, not permanent additions to every side. The distant red-roof building is a separate neighbor and should not be fused into Diamond Jubilee.

P06-P07: frontage materials and entrance feature

P06: interlocking pavers, aggregate/construction remnant, planting strip and entrance farther along the wing.

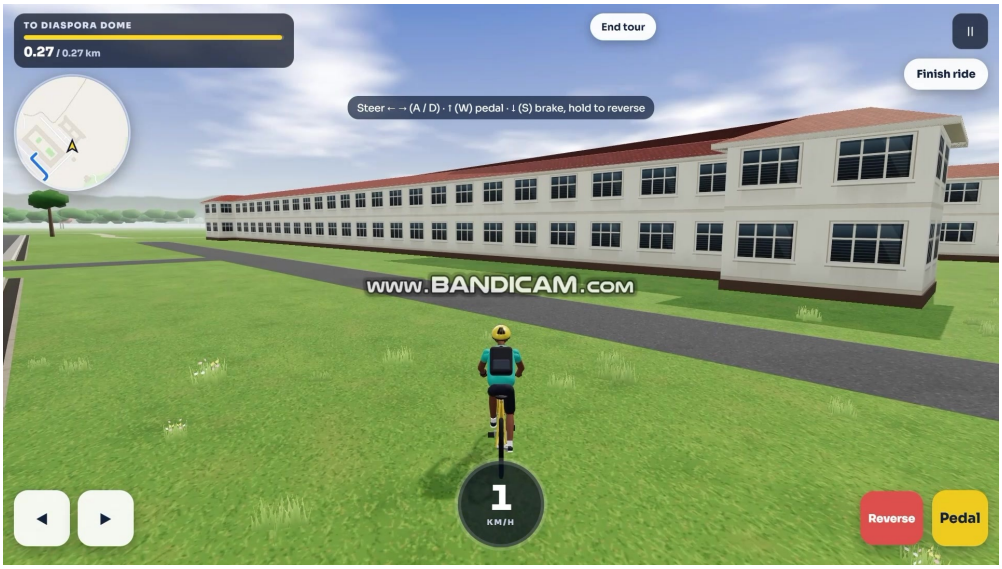

P07: grey/dark entrance feature, flat projecting canopy, parked cars and separate lawn/kerb strip.

The frontage uses small interlocking units in grey/tan tones, with visible laying patterns and joints. Do not use uninterrupted black asphalt, giant paving squares or a pale dirt texture as a substitute. Grass islands and perimeter beds are constrained polygons with kerbs.

P06’s aggregate pile and P02’s scaffold are not evidence to place obstructions throughout the more finished video frontage. Preserve permanent material boundaries, then identify optional temporary construction objects explicitly.

Comparison: rebuild height, not just facade decoration

G02 | 00:05 | bandicam 2026-10-15 01-09-17-947_exported.mp4

Real target P03: four principal levels, taller screened tower and a much finer opening scale.

Mistake: the game has two rows of oversized windows and a low accommodation mass. Adding a black panel to that mass will not fix the floor count or silhouette.

DJ-02 correction: establish ground, level 1, level 2 and level 3 consistently across each wing and courtyard wall. Rebuild slab/roof heights and resize openings independently. Keep the tower extension/tanks distinct from occupied levels.

Acceptance: front, rear and courtyard captures all show four coherent occupied levels without stretched windows, a hidden fifth floor or an enlarged roof. Calibrate length/height from the registered plan plus elevation photos; no exact metre dimensions are supplied.

Comparison: replace the generic window module

G04 | 00:16 | bandicam 2026-10-15 01-09-17-947_exported.mp4

P06 crop: varying louvred openings and service slots along the four-level wing.

Mistake: G04 uses large near-square dark panes with thick white cross dividers, repeated uniformly. Real openings are smaller relative to walls and include broad/narrow pairs, very narrow slots and short horizontal service windows.

DJ-04 correction: create a facade bay ledger from left to right for each elevation and level. Distinguish solid wall, broad louvre, narrow companion, short slot, door, screened core and open landing. Use dark slim frames/louvre lines; do not infer wooden shutters or full curtain wall from dark shading.

Acceptance: an enlarged game crop has the same solid-to-opening rhythm as P03/P06/P01. Check each visible row separately; do not mirror the front onto the courtyard or carry a room-window module across a core wall.

Comparison: stair screen, landings and lettering

P03 numbered tower details. These annotations identify separate geometry/material tasks.

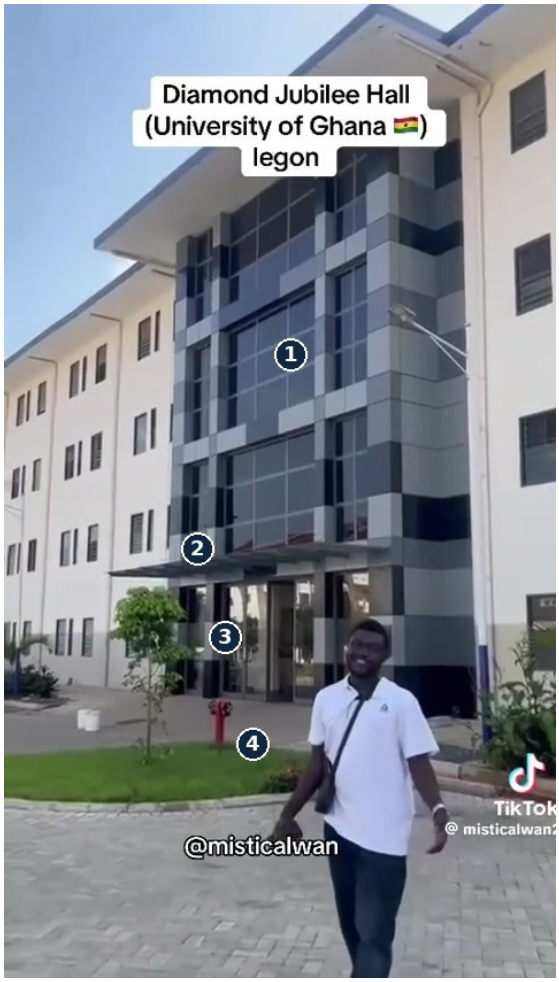

1. Fin screen: slender dark vertical members with transparent gaps; stair flights and landings visible behind. Use instanced fins or a tested cutout material with depth at close range, not an opaque black slab.

2. Named side strip: apply correctly spelled “DIAMOND”, “JUBILEE HALL” and the visible stylized 75 emblem to the pale face. Use subtle 3D lettering or a clean decal aligned to the actual wall; no floating billboard label.

3. Side landings: open stacked recesses/guard details, not another room-window row. **4. Base:** pale opaque wall with the actual visible entry/gate only where shown. **5. Roof:** black tanks on the service/tower roof, sized as roof equipment.

DJ-03 acceptance: from a close oblique view, fins remain separated, stairs read through the screen, openings retain depth and lettering sits on the correct surface. Do not add pillars across a usable passage.

Entrance: glazing, grey frame and canopy

R09 | 01:42: entrance feature. Source video is portrait and partly occluded by a person; use P07 for context.

1. Upper feature: dark blue-grey glazed panels with thin framing, bordered by a patterned arrangement of grey/charcoal/light rectangular facade panels. This is a localized entrance composition, not a coating for all bedroom wings.

2. Canopy: thin flat projecting glass/dark-framed canopy with visible support/rib lines. Not a pitched tiled porch or thick concrete staircase roof. **3. Ground:** glazed doorway/sidelight zone; preserve the actual clear path and avoid invented bulky columns.

4. Approach: low grass island, kerb, interlocking paving and a red hydrant-like object visible nearby. Model its placement only where supported; it is not a building column. **DJ-05 acceptance:** entrance sits along the correct wing and does not get duplicated at end towers.

Courtyard: reconstruct the open spaces carefully

P01 close crop: low rectilinear bed/retaining edges, paved circulation, young planting and unfinished materials.

DJ-08 | Two distinct courts. M01 shows two internal openings. P01 explains one inner court in detail, but the photo alone does not conclusively establish which opening without matching its wall/balcony arrangement to the plan. Register this before assigning its planting design to a specific court.

DJ-09 | Ground composition. Build low geometric bed/retaining outlines and walkway gaps as actual low geometry with passable routes. Distinguish soil/planting from hard paving. The low raised edges are not building foundations requiring extra rooms; do not build a maze of full-height walls.

DJ-10 | Interior-facing walls. Keep four levels, louvred openings and the stacked corner balcony/landing recesses. The far wall has broad regular bays; side walls use different proportions. Preserve solid wall partitions and rail/parapet thickness.

Chronology: P01 shows unfinished work, loose blocks and tools. The current finished courtyard design cannot be fully established from this photo. Reproduce its supported permanent layout; treat scattered construction items as optional dated state. Do not invent a fountain, water basin, room layout or underground floor.

Acceptance: overhead shows both courts open to sky; inside view matches the correct wall bay sequence; paths connect around beds without steps/barriers invented from perspective. Unseen room interiors and the second courtyard’s fine planting remain unresolved.

Roof, eaves, drainage and roof equipment

P05 crop: low pitched roof/eave line, fin-screened tower, four-level facade and rooftop black tanks.

DJ-11 | Roof massing. Follow the elongated roof runs around both courts. The satellite shows muted reddish/brown roof surfaces; photos show relatively low slopes and thin dark fascia with pale soffits. Do not infer a flat roof for the whole hostel merely because the eave looks flat at street level.

DJ-12 | Overhangs. Reproduce broad overhangs at the entrance/tower-associated volumes where visible and thin eaves along ordinary wings. The game’s generic bulky hip projections at corners are not a substitute. Separate the main pitched roof, tower top and entrance canopy.

DJ-13 | Services. Include visible black cylindrical tank groups on service/tower roofs, slim downpipes at wall/eave junctions and supported utility details. Tank count/position must be checked from M01 and P02-P05; not every dark roof mark is a tank.

Use enough roof planes to preserve the two courtyard openings and cross-connection. Keep eaves outside wall faces without cutting through landing openings. No extra occupied storey should be inferred from parapet/tank height.

Acceptance: street silhouette and overhead roof plan agree. Roof planes do not cap courts; tanks sit on supported roof zones; pipes do not float or cross windows; canopy thickness remains distinct from roof mass.

Materials and painting: preserve subtle differences

DJ-14 | Main walls: warm white/off-white to light cream, with a light beige/peach lower band. The courtyard and exterior show this pale base. Replace the game’s dark brown plinth on the target asset where it contradicts the references. Do not tint all walls yellow from sunset lighting.

DJ-15 | Openings: dark slim frames and horizontal louvre/slat character, with grey/green-blue glass as resolved. Use geometry or a crisp material appropriate to viewing distance. Do not make every opening a large black mirror or add thick white crossbars absent from the reference.

DJ-16 | Entrance: local grey/charcoal/light panel pattern and blue-grey glass. Preserve the exact distribution around glazing where visible. It is not a random checkerboard painted across the full block.

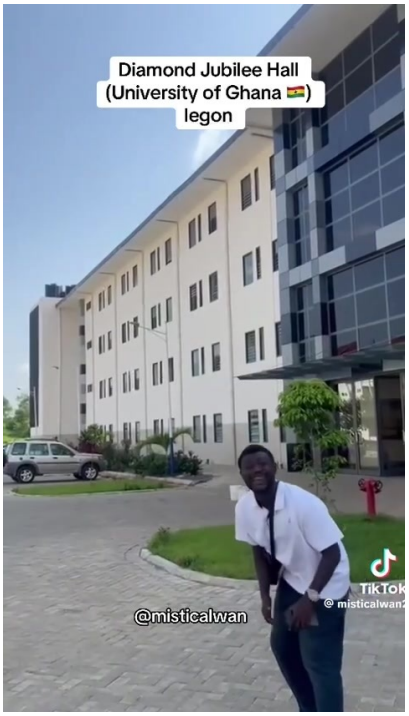

DJ-17 | Stair cores: dark grey/black fin members, pale outer frame and slightly shadowed internal stairs. A black appearance here is the screen/shadow system, not the exterior color of the entire tower. Gaps must remain visible.

DJ-18 | Ground: small grey/tan interlocking pavers at the frontage; pale concrete kerbs/bed edges; reddish compacted earth on rough sides; irregular green grass and shrubs. Material masks must follow real boundaries instead of using one universal grass texture.

Lighting check: compare material swatches under consistent daylight in the game, then verify under an oblique sun angle. Screens, glass and solid wall should remain distinguishable. Avoid sampling sun glare, shade or a watermark as the intended base color.

Acceptance: front, rear and courtyard share a coherent paint system, but window types, entrance cladding and fin screens remain distinct. Colors support structural legibility rather than concealing a wrong mass.

Pavers, kerbs, entrances and drainage

R12 | 02:09: small paved units, curbed lawn island, planted perimeter and entrance approach.

DJ-19 | Frontage. Replace only the evidenced lawn/black-strip area with the correct paved forecourt and parking/access geometry. Maintain the separating public/access road as a separate asset; do not replace all roads with decorative paving.

DJ-20 | Islands and beds. Draw the rounded lawn island near the entrance, long narrow planted beds at the facade and their kerbs as separate masks/meshes. Not every green area is a tall bush; some are trimmed grass with a small tree.

DJ-21 | Drainage and edges. R04/P01 show a defined channel/recess along some edges. Trace supported segments and provide plausible continuity; do not create an open trench across the main entrance based on a single shadow. Keep paving flush or gently graded where actual access needs it.

Acceptance: the rider can approach the door and circulate on the paved frontage without hidden collisions, floating kerbs, oversized paver texture or abrupt road seams. Frontage width is calibrated against the building setback, not from a portrait frame alone.

Rear terrain, bushes and surroundings

P05: red-earth access and rough vegetation form a different ground zone from the main paved frontage.

DJ-22 | Rear/service side. Preserve broad compacted red earth and irregular grass/scrub at the service edge, using P04/P05 and M01. Do not turn the track into asphalt or fill the whole area with tidy lawn. Grade only what is visible; this set does not establish a measured hill profile.

DJ-23 | Planting. Front: small palms, low shrubs, flowers and young trees in bounded beds. Rear: taller grass and rough bush. Use efficient grouped low shrub masses where suitable, while keeping key trees distinct. Avoid many oversized round tree assets around every wall.

DJ-24 | Small assets. Place supported slender frontage lights, white/blue lower pole portions where visible, hydrant-like object, bins and roof/service elements. Do not copy temporary people, vehicles, scaffold or aggregate into every view. Parking spaces may be represented without preserving transient vehicle positions.

DJ-25 | Neighbor protection. Jean Nelson, nearby roads, courts and detached service structures are context. Change them only where the registered layout demonstrates an interaction with this hostel correction. Do not use a route HUD name to relabel neighboring buildings.

Feature ledger: required modelling decisions

Before changing each asset, record: scene ID; source frame/photo and crop; local facade side; level/bay index; action (retain/add/reshape/relocate/remove); geometry; opening/solid classification; material; confidence; and acceptance capture. All DJ issue IDs on pages 5 and 18-26 need a ledger status.

Facade indexing: define local A = entrance/frontage long side, B = rear/service long side, C/D = short ends after registration. Label courts C1/C2 by their position in M01, not invented compass directions. For each level count left-to-right broad louvres, narrow companions, short slots, doors and solid piers separately.

Screened-core ledger: tower footprint, frame width, fin direction/spacing, visible wrapping face, flight/landing heights, side recesses, base opening, lettering strip and tank group. Do not merge screen, stair and opaque wall into one black plane.

Entrance ledger: localized glazed volume, grey panel pattern, canopy extent/thickness, door/sidelight divisions and entry route. Do not assume all dark panes are doors. Keep people and billboard/video overlays out of geometry interpretation.

Courtyard ledger: court identity, wall bays, balcony recess sequence, low bed outlines, path connectivity, drainage edge and completion state. P01 is evidence for open-air interior-facing architecture; it is not enough to design hidden bedrooms, bathrooms or a full indoor corridor network.

Confidence: confirmed = resolved in a supplied view; supported inference = consistent across views but needs registration; unresolved = hidden/ambiguous. Exact metre dimensions, unseen facades and precise construction chronology must not be presented as measured fact.

Compulsory close-up inspection clause

MANDATORY - zoom, classify and verify every structural feature. Claude must open all seven photos at original resolution and inspect the selected video frames at source resolution, revisiting adjacent moments when useful. A contact sheet or satellite thumbnail is not sufficient for placing columns, walls, windows or doors.

Inspect in order: correct asset identity and footprint; four-level massing; roof/eaves; stair cores; entrance; wall partitions/openings; courtyard landings and ground; colors; environmental detail. Do not decorate a wrong two-level model and call the structural correction complete.

At each facade bay, explicitly classify solid wall, broad louvre, narrow slot, service window, door, open landing or stair screen. Count features floor by floor. Never place a window in a solid pier, turn a recess into a flat panel, add supports across a passage or copy an opening grid through an obscured zone.

Create close crops for screen gaps/stair diagonals, entrance canopy/door zone, paired windows, horizontal service slots, courtyard balcony edges and low bed geometry. Do not use AI-generated sharpening or invented imagery to decide small structural features that the source cannot resolve.

Use source dates cautiously. P01/P02/P04/P06 show work in progress; the real video shows a more usable frontage. Retain permanent geometry and mark temporary construction objects separately. Do not invent a precise current courtyard finish from the video, which does not enter the court.

When detail is hidden, record “unresolved,” build only a clearly marked provisional mass if necessary and state the additional view required. No unseen room plan, basement, window count, exact height or stair continuation should be asserted as confirmed.

Completion gate: each resolved issue needs a matched after-capture plus an adjacent/oblique check. Code changes alone are not proof. Give a per-feature ledger, not a statement that the block “looks better” or “matches perfectly.”

Implementation sequence and performance

1. Register and isolate: Locate the exact Diamond Jubilee object(s), source footprint and neighboring Jean Nelson asset. Save a reversible baseline. Align the two courts, long axes and separating road.

2. Rebuild structural mass: Set ground plus three upper levels. Correct wing widths/lengths, cross-connection and two open courts. Keep occupied roof height separate from service towers/tanks.

3. Build defining features: Model the fin-screened stairs, open landings and localized entrance volume/canopy. Verify the hierarchy and silhouettes before repeating room openings.

4. Place openings: Use per-side/per-level bay ledgers. Build the correct window types and solid piers; add courtyard openings and balcony recesses independently. Keep uncertain bays flagged.

5. Roof and finish: Resolve roof runs/eaves and tank locations; assign pale wall/base colors, dark fins, localized entrance panels and restrained glazing. Make no global neighbor-material replacement.

6. Site and circulation: Create pavers, road/forecourt separation, lawn islands, kerbs, drainage edges, rear red soil, low shrubs and lights. Test entrance and courtyard circulation.

7. Optimize and verify: Instance repeat windows/fins/roof details; use shared materials and sensible detail levels. Use grouped scrub geometry for dense rough bush. Preserve near-camera fin depth and opening silhouettes; check transparency artifacts and collisions.

Update map/source footprint only if the registered world correction requires it. The supplied map’s coarse two-court topology is useful and should not be discarded simply because the current facade is wrong.

Acceptance checks and required evidence

Geometry: four occupied levels on every visible wing; two open-to-sky courts; correct relationship to Jean Nelson; no stretched room windows or accidental fifth floor. Roof/eaves and tank towers match their supported locations.

Facade: broad/narrow louvred openings, short service slots and solid piers follow the source. Stair screens have gaps and depth; visible stair diagonals and open side landings are retained. Lettering is correctly spelled and attached to the named tower.

Entrance: localized glazed/grey composition with a thin flat canopy and usable door approach. No duplicate entrances at every corner, invented columns or opaque barriers across the access.

Courtyard: the supported low-bed/path layout is assigned only after court registration. Four-level walls and balcony recesses match P01. No fictitious fountain, room block or roof fills the court. Temporary construction items are clearly separated from permanent design.

Materials and environment: pale walls/light base, fine dark openings, interlocking frontage pavers, kerbed lawn islands and rough red-earth rear zone. Frontage lights, plants and service detail follow evidence; no blanket lawn or forest of oversized trees.

Gameplay/performance: bicycle passage and door approach are clear; courtyard path connectivity works if accessible; collision meshes agree with visible structures; no road/kerb seams or duplicated neighbor assets; repeated details remain efficient without flattening critical geometry.

Claude must return: changed code/assets and scene IDs; DJ issue ledger; overhead before/after; front wide view; named stair oblique; entrance close-up; rear dirt-side view; courtyard interior view; window crop; and test results. Status each issue as visually verified, implemented but unverified, or unresolved.

Use matching camera heading, field of view and approximate height wherever practical. Real/game recordings have different routes and durations; timestamps identify evidence only, not synchronized viewpoints.

Consolidated Claude prompt - 1 of 4

Reconstruct Diamond Jubilee Hostel/Hall behind Jean Nelson Aka Hall in LEGONRUSH. Use this PDF, both original videos, the seven additional photos and two maps together. The current game tour shows a generic two-level block that does not capture the real four-level hostel, screened stairs, entrance, varied openings or site surfaces.

SOURCE IDs: V-R = IMG_6894.MP4, 02:18.10, portrait real-world frontage tour. V-G = bandicam recording, 00:44.14, bicycle-height game tour. R01-R12 and G01-G08 are timestamped selections in chronological order within each video; they are not synchronized pairs. P01-P07 follow the original photo_1 through photo_7 names. M01 is the supplied satellite image, visibly Google Maps. M02 is the game/vector map.

FIRST register and identify the correct asset. M01 shows the smaller double-courtyard Diamond Jubilee block beside the larger Jean Nelson compound. M02 already suggests two court openings. Preserve correct coarse topology and verify the actual mesh against it. The game HUD/nearby label says Diaspora Dome; do not treat this as proof that all visible buildings are Diamond Jubilee, and do not overwrite a neighbor on the basis of a route name.

MANDATORY inspection: open all originals, make close crops, and create feature ledgers before editing. Classify every visible wall bay as solid, broad louvre, narrow slot, service window, door, open landing or stair screen. Count by side and floor. Record source, orientation, confidence, scene ID and action. Never invent windows in piers, columns across a path or hidden opening counts.

Evidence hierarchy: satellite for footprint/site relationships; sharp photos for architectural detail; real video for continuity/current usable frontage; game video for actual demonstrated errors. Photos include work-in-progress details, and their capture dates are unknown. Retain permanent geometry while keeping temporary works separate.

This is implementation work: inspect the actual game project, replace or reshape only confirmed target assets, then deliver before/after visual proof and tests. No generic “improve the hostel” response is sufficient.

Consolidated Claude prompt - 2 of 4

STRUCTURE: replace the evidenced two-level appearance with ground plus three upper levels. Establish floor elevations and opening sizes separately; do not scale the entire prefab vertically. Maintain two open courts with a central connection and correct wing thicknesses. Tank/service-tower roof extensions are not extra residential floors.

STAIRS: build pale tower frames with close dark vertical fins, visible gaps, set-back landings and diagonal stair flights behind. Preserve the screen’s corner wrapping and open side landings shown in P02/P04. Keep the lower solid base distinct. Do not use a solid black wall or arbitrary boxes/windows in place of the stair system.

LETTERING: on the supported named stair face, place “DIAMOND”, “JUBILEE HALL” and the visible stylized 75 emblem with correct orientation and restrained relief/decal treatment. Do not float a generic label in front of the roof. Preserve only tank groups supported by photos/map, not tanks on every roof module.

OPENINGS: discard the current oversized white-cross square-window module for the target block. Use the observed broad/narrow louvred room openings, narrow slit companions and short horizontal service windows, separated by real solid piers. Different elevations and courtyard walls require distinct bay ledgers. Do not assume shutters are wood or turn the room wings into curtain walls.

ENTRANCE: create the localized multi-level blue-grey glazed feature bordered by its light/grey/charcoal panel arrangement. Add the thin flat glass/dark-framed canopy and actual ground door/sidelight zone with a clear approach. Keep the nearby red hydrant-like feature separate from supports. Do not duplicate the entrance at each end or add bulky columns across it.

ROOF: follow the real low-pitched roof runs, thin fascia/pale soffits, broad supported overhangs and the two courtyard voids. Use M01 with photos to reconcile shape/color. Do not keep generic bulky hip projections where contradicted, cap the courts with roofs, or infer a flat roof everywhere from street-level eaves.

Consolidated Claude prompt - 3 of 4

COURTYARD: P01 shows open-air inner architecture with four window levels, broad regular end-wall bays, different side-wall openings, stacked corner balcony/landing recesses and low geometric beds/paths. Register which of the two courts it is before placing the design. Make low edges and path gaps as real passable geometry, not full-height partitions.

P01 contains unfinished work and loose blocks. Preserve supported permanent bed/path organization; treat scattered materials as dated optional state. The supplied video does not enter the courtyard. Do not invent fountains, pools, bedrooms, bathrooms, underground floors or a finished design for the unseen second court.

MATERIALS: warm white/off-white main walls; light beige/peach lower band; dark fine louvre/frame detail; dark fin screen with actual transparency; localized grey entrance panels; low-profile muted reddish/brown roof supported by map/photos. Remove unsupported dark-brown base treatment on the target only. Do not sample sunlight or deep shadow as paint.

FRONTAGE: restore broad grey/tan interlocking-paver forecourt and approach, separate the road from paved access, and trace lawn islands, facade planting strips, pale kerbs and supported drainage recesses. Do not replace all existing roads with pavers; correct only registered material zones. Preserve gentle passable transitions at doors and paths.

REAR/SERVICE: restore the red-earth access area, rough grass and shrubs in P04/P05/M01. Do not interpret the track as asphalt or convert it all into manicured lawn. No measured terrain profile is provided; make only supported local grading changes.

ENVIRONMENT: use small palms/low shrubs/young trees along the front and rougher grouped grass/bushes behind. Include supported slender lights, service objects and rooftop tanks. Efficient shrub masses/instancing are preferable to many oversized tree objects. Preserve neighboring Jean Nelson geometry and separate detached service structures from the hostel.

Consolidated Claude prompt - 4 of 4

IMPLEMENTATION ORDER: locate/verify scene IDs; register footprint and neighbors; rebuild four-level mass/two courts; add screened stairs and entrance; place bay-specific openings; resolve roof and materials; restore paving/soil/landscape; optimize; verify. Keep changes reversible and local to Diamond Jubilee and its immediately evidenced ground zones.

For every resolved detail, use the original crop plus a matching game after-capture and an adjacent/oblique check. Review fin gaps/stairs, window proportions and piers, landing recess depth, roof outlines, entrance canopy/doorway, low courtyard beds and path connectivity. Code edits alone do not prove a visual match.

TESTS: no supports/fences/trees block entrance or bicycle routes; collision agrees with walls, stairs and beds; road joins/kerbs do not float or create abrupt seams; roof does not cap courts; no duplicate buildings or misplaced tank groups; transparency and detail levels preserve the stair screen at rider distance.

Use repeated window/fins/mullions efficiently, shared materials and suitable detail levels. Preserve structural openings and close-range depth. Avoid flattening the entire screen or entrance into opaque textures simply to reduce object count. Update the minimap source only where registration proves the footprint needs correction.

FINAL RESPONSE: list changed code/assets and exact scene IDs; provide a DJ-01 through DJ-25 issue ledger; show overhead before/after, front wide, named-stair oblique, entrance close-up, rear earth-side, courtyard and window-crop comparisons; summarize functional/performance checks; and identify unresolved details. Status each issue as visually verified, implemented but unverified, or unresolved.

State the calibration basis for any metre dimensions. Unseen rear/room detail, exact date of construction stages, the second courtyard’s finish and hidden opening counts must remain unresolved unless new evidence settles them. Do not claim “perfect match” or invent a floor/window/pillar where the source is unclear.

Evidence limits, frame index and handoff

Selected real frames: R01 00:03, R02 00:10, R03 00:20, R04 00:26, R05 00:30, R06 00:38, R07 01:02, R08 01:38, R09 01:42, R10 01:54, R11 02:02, R12 02:09.

Selected game frames: G01 00:01, G02 00:05, G03 00:13, G04 00:16, G05 00:25, G06 00:35, G07 00:40, G08 00:43.

Frame times are explicit extraction positions in the original files, not video capture dates. The real recording is a compressed social-video source with text/watermarks and presenter occlusion. The game recording has UI/watermarks. These overlays are not architectural detail and must not appear on the reconstructed building.

The selected views cover the useful changes in angle/detail without repeating the long stationary presenter sequence or end cards. Originals remain authoritative for revisiting hidden moments. No AI-generated images were used as architectural evidence.

Not established: measured dimensions; a surveyed north/terrain profile; complete hidden room/corridor layout; precise chronological dates; every facade bay; fine finish in both courts; or equipment identity for the detached utility-like group. A provisional mass is acceptable only when clearly labelled and easy to revise.

Handoff: send this full PDF with both videos, the ZIP photos and the two original maps. The compulsory close-up inspection clause is on page 28. Consolidated Claude prompt: pages 31-34. All 20 selected screenshots and all seven photo references are embedded in this document.
