Legon overhead to Okponglo reconstruction brief

This brief compares 16 game views with their real references along the Legon overhead to Okponglo route, including Legon First, the Family Health vicinity, TotalEnergies and Pizzaman lane. Correct the observed roadside structures, station, terrain, retaining walls, vegetation and utilities in the existing bicycle game. Four owner annotated aerials establish placement and direction; the current game map provides context for checking map data.

Implementation order

1. Register map data roads footprints and access gaps against the four real aerials.
2. Correct shared building masses roofs boundaries and local ground relationships.
3. Restore highway divider transitions compact planting rough land and roadside stalls.
4. Add visible glazing signs pavement drainage poles wires and streetlights.
5. Match all 16 cameras test bicycle movement and return comparison captures.

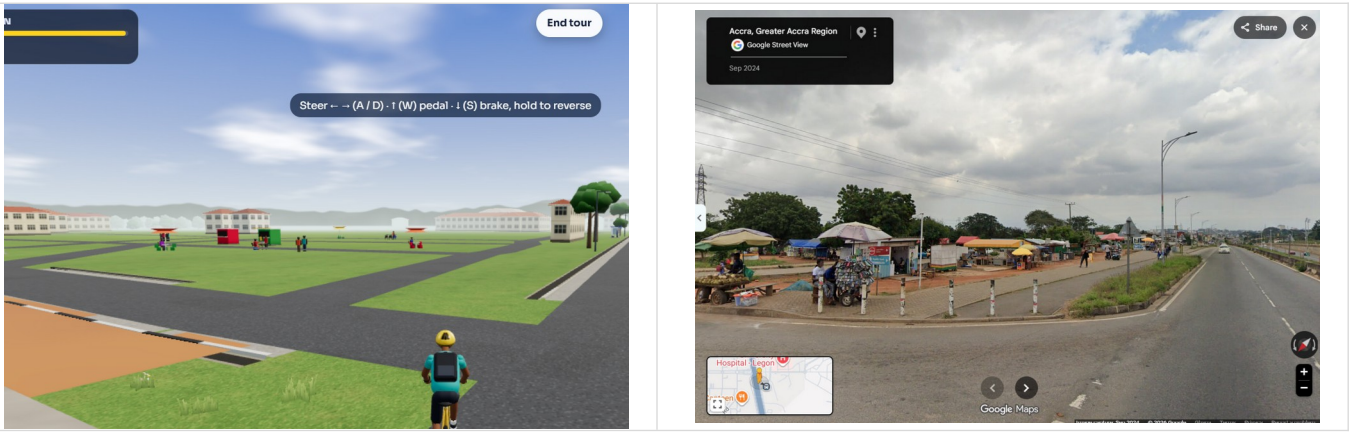

How to use the references

Pairs 1 to 10 use the first uploaded set; Pairs 11 to 16 continue with the second set. The duplicate real image sent after Pair 14 is identical to its retained reference. The game is left and real view right. Each pair contains mistakes, the real target, four sequential correction steps and an acceptance check. A01 covers 11 to 14, A02 covers 5 to 7 and 15, A03 covers 1 to 4, and A04 covers 8 to 10 and 16. M01 is the game map. The consolidated Claude prompt follows all five map pages in three consecutive parts; paste all parts together.

Shared objects and uncertainty

Keep this work separate from other completed zones. Several pairs show the same compound, office or trading frontage and must share scene objects. Preserve every owner arrow, including numbers with more than one direction. Map labels are location clues, not proof of physical building names. Match viewpoints before judging proportions; keep uncertain dimensions adjustable. Trees and roofs may hide structures, so occlusion alone is not grounds for deletion. No unseen interiors, hidden connections or exact terrain measurements are prescribed.

Pair 1 Roadside trading corner and highway approach

In-game view left | Real street view right | Placement and viewing direction A03 all directions marked 1

Visible mistakes The game reduces the corner to small scattered booths on lawn, surrounded by invented campus-style blocks and broad angular paved paths. It misses the continuous trading frontage, curb island, short posts and highway approach geometry.

Real target The target has a curved road mouth, a brick-paved corner and short striped posts. Umbrellas, low kiosks and mixed canopy stalls sit on bare reddish earth behind the footway, backed by mature trees. A narrow grassy edge separates pedestrian space from the descending-looking highway; decorative streetlights and overhead cables continue along it.

Step by step instructions for Claude

1. Register the road corner with every direction marked 1 in A03, including the long road-facing arrows. Connect the side lane into the correct highway edge without a broad rectangular lawn junction. Use Pair 2 to validate the same corner.

2. Replace scattered tiny booths with individually sized kiosks, umbrellas and low shelters arranged along the observed trading line. Keep open earth and pedestrian gaps; remove template blocks only from aerial-confirmed conflicting plots.

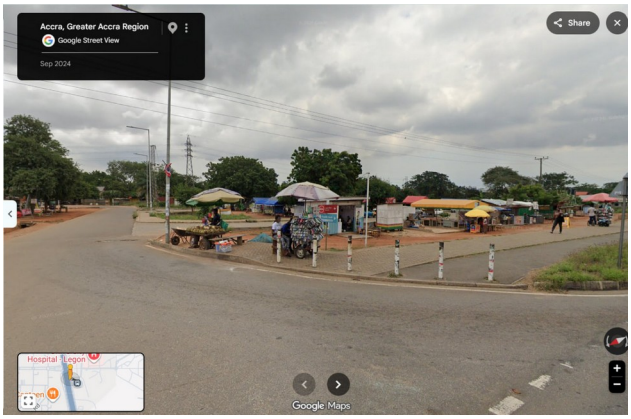

3. Build the curved curb, brick-paved pedestrian corner, short weathered striped posts and narrow grass wedge. Match the road's visible longitudinal fall with adjustable grade; do not flatten the entire approach or infer a precise slope angle.

4. Add mature leafy background trees, low rough ground planting, decorative branching lamps, poles and wire spans. Distinguish umbrella stalls from enclosed kiosks and any genuine shelter; no generic bus-stop mesh should replace every roadside structure.

Acceptance check The matched corner should show a compact trading frontage behind a curved paved edge, with a clear connected lane. Pair 2 must show the same structures from its different angle.

Pair 2 Side lane junction beside the trading frontage

In-game view left | Real street view right | Placement and viewing direction A03 arrow 2

Visible mistakes The game junction has broad intersecting asphalt strips and large clean lawns. It lacks the real rounded corner, brick footway, kiosks, umbrellas and enclosed low structures.

Real target A side lane branches beside the trading area. A curved corner footway and short white posts with dark or faded bands enclose stalls close to the pavement. Bare soil and small varied structures sit behind them; large green trees provide the backdrop. The highway edge remains a different surface and scale from the side lane.

Step by step instructions for Claude

1. Place a validation camera along A03 arrow 2. Reuse Pair 1's corner and trading structures rather than adding a second market; align the branching road to the aerial lane, not the game's angular default paths.

2. Correct the lane mouth width, curved corner and sidewalk outline. Preserve paved pedestrian space in front of the stalls and keep the vehicle lane open; use adjustable dimensions until the camera and map agree.

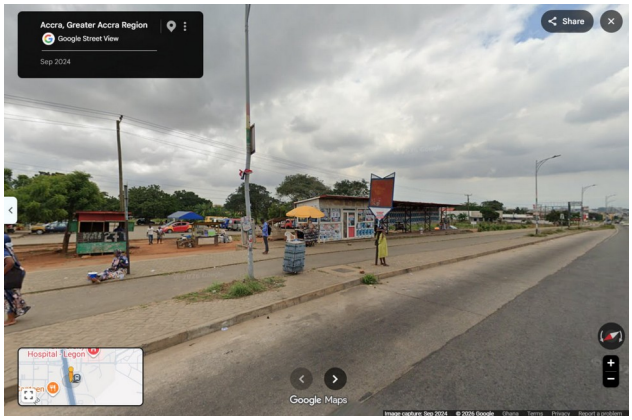

3. Arrange the front umbrellas, open display stalls and enclosed kiosks in their real sequence. Preserve differences in roof height, wall materials and setback, with reddish soil between structures instead of grass.

4. Add the short posts, worn curb, pole bases, overhead services and the mature trees behind the lane. Treat visible people and parked vehicles as optional later scene activity rather than fixed footprint anchors.

Acceptance check The two views should resolve to one curved corner and one trading cluster. The side lane must connect smoothly and remain navigable by bicycle without intersecting stalls or posts.

Pair 3 Small roadside kiosks and shelter line

In-game view left | Real street view right | Placement and viewing direction A03 both directions marked 3

Visible mistakes The game substitutes isolated institutional blocks and tall regular trees for low roadside kiosks and a longer sheltered structure. The paved verge and physical boards are mostly absent.

Real target The frontage contains a small dark-green and reddish kiosk, umbrellas and counters, a light-coloured shop with poster-covered panels, and a longer low roof on narrow supports or grilles. A brick footway runs in front, with bare soil behind. A tall narrow roadside board, streetlight, concrete utility pole and wires are visible.

Step by step instructions for Claude

1. Follow both directions marked 3 in A03 and keep the kiosk line consistent with Pairs 1 and 2. Register the shelter footprints and paved edge before replacing game objects.

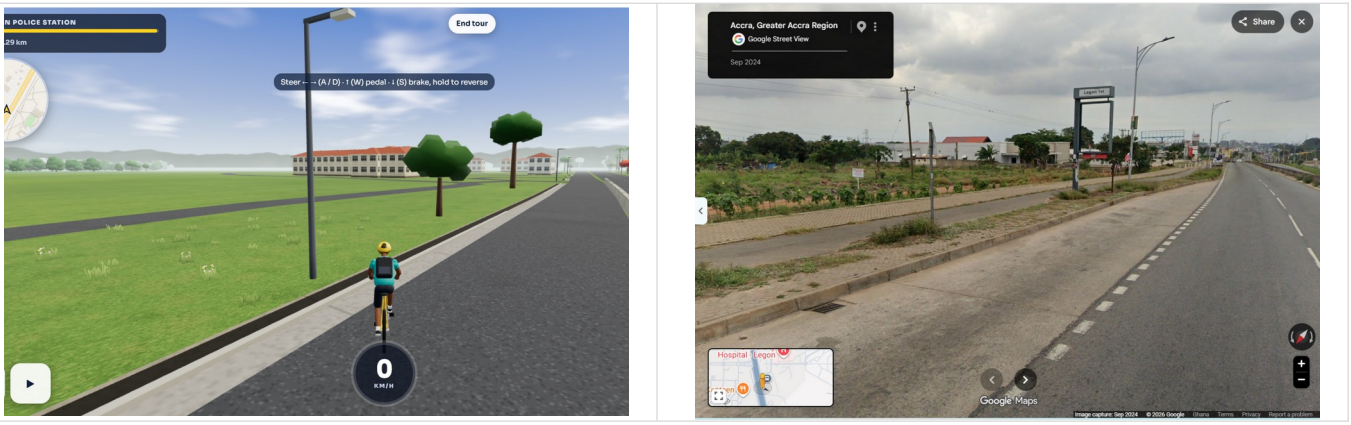

2. Build the dark small kiosk, light shop and longer sheltered structure as separate assets with their own heights, open or enclosed fronts and shallow roofs. Copy visible grille or support rhythms; do not assume the long shelter's function from its roof alone.

3. Restore the pedestrian pavement, curb and rough soil strip, keeping space for walking and bicycle routes. Reproduce visible counter or display massing without inventing every item of merchandise.

4. Add physical kiosk panels and the roadside sign on its actual supports. Transcribe legible names only; keep small poster text adjustable. Replace ornamental game trees with the observed mature background foliage and add the distinct pole and lamp designs.

Acceptance check The viewpoint should show a sequence of small, varied trading structures beside the footway, including the longer shelter. None should retain the height or window grid of a campus building.

Pair 4 Legon 1st roadside frame and open plot

In-game view left | Real street view right | Placement and viewing direction A03 both directions marked 4

Visible mistakes The game creates smooth lawn and distant repeated blocks, omitting the large roadside sign frame, rough open plot, drain inlet and specific roadside edge.

Real target The road passes a tall dark rectangular sign frame with a small pale name panel reading Legon 1st. Much of the frame below is empty. Behind the brick pedestrian route are irregular scrub, bare earth and low scattered plants; a white red-roof structure is visible farther back. Decorative lamps and overhead services line the road.

Step by step instructions for Claude

1. Preserve both directions marked 4 in A03, including the road-facing direction. Register the sign and open plot separately from the filling station farther along; do not populate the clearing with repeated campus blocks.

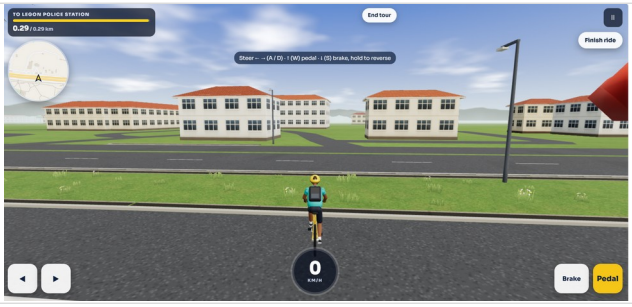

2. Build the tall dark open frame with thin members and the small top name panel. Preserve the empty lower opening rather than filling it with an invented advertisement. Verify letter shapes at source resolution before finalising the name texture.

3. Replace lawn with patchy scrub, exposed soil and modest low plants. Use the aerial footprint for the distant white red-roof structure and keep hidden elevations conservative.

4. Restore the brick footway, narrow verge, road shoulder, curb and visible rectangular drain grate or inlet. Include the correct decorative lamp and thin service wires, with the road grade matched across adjacent views.

Acceptance check The sign's large empty frame should be clearly recognisable above a rough open plot. Pair 3's busy trading line should give way to this sparser frontage without a sudden invented building row.

Pair 5 Filling station plot and neighbouring commercial building

In-game view left | Real street view right | Placement and viewing direction A02 both directions marked 5

Visible mistakes The game fills the site with several two- and three-storey red-roof blocks on lawns. It lacks the low commercial buildings, large hard forecourt, roadside entry curve, utility frames and striped posts.

Real target The plot contains a broad paved forecourt, a low grey flat-roof takeaway building, a service strip with large open bays behind it and a separate pale building with a red roof at the side. A curved access edge has brick paving, grass islands and short red-and-white posts. Electrical frames and a tall communications support stand near the frontage.

Step by step instructions for Claude

1. Follow both directions marked 5 in A02. Register the large red-roof neighbouring building, station buildings and forecourt as distinct footprints. Reuse the station scene in Pairs 6 to 8 and 10; do not duplicate each view as a separate business plot.

2. Replace the template blocks with low commercial masses. Keep the pale red-roof neighbour separate from the grey takeaway building and service bays; use aerial roof outlines and street elevations together.

3. Build the broad hardstanding, actual entry mouth, curved curb, brick walking area, grass islands and short red-and-white posts. Avoid a public roadway drawn through the shop footprints or a lawn extending under the station canopy.

4. Place visible utility frames, slender palms, communications support and shop signage. Add the façade openings and exterior equipment from Pair 6; keep names on partly hidden neighbouring buildings unassigned unless physically readable.

Acceptance check The site should read as a low commercial forecourt with separate buildings and a curved roadside entrance. Its footprint must agree with the aerial and the opposite-angle entrance in Pair 10.

Pair 6 Takeaway building and service bay frontage

In-game view left | Real street view right | Placement and viewing direction A02 arrow 6

Visible mistakes The game uses large red-roof institutional blocks instead of a low flat-roof takeaway building and garage or service strip. It omits signage, air-conditioning units, open bays and forecourt paving.

Real target A squat grey takeaway building has dark windows and physical Chickenman, Pizzaman and DRIVE THRU signs along its white fascia. Multiple white air-conditioning units sit on the grey face. Behind it, a low pale service strip has deep open bays and readable larger signs including auto service and wash; other wording needs closer transcription. The ground is expansive worn concrete.

Step by step instructions for Claude

1. Use A02 arrow 6 to place the takeaway building in front of the rear service strip. Keep it shared with Pairs 5, 7, 8 and 10 and preserve the setback between the two masses.

2. Model one low grey flat-roof volume with white fascia, observed dark window sizes and white external air-conditioning boxes. Restore the service strip's broad bays, columns and deep shadowed openings, rather than another glazed campus façade.

3. Build the visible brand and DRIVE THRU signage as mounted physical boards or letters with depth and actual supports. Copy the clear main text; verify the remaining service names from the original images and keep uncertain small text editable.

4. Replace grass and lane-like paths with worn forecourt concrete, bay approaches and the small fenced or railing detail at the takeaway edge. Include short posts, entry curb returns and overhead services; keep shop interiors to visible depth only.

Acceptance check The grey takeaway building, physical brand signs, external air-conditioning units and rear open bays should all be recognisable. The reference's low roofline must replace the multi-storey game massing.

Pair 7 TotalEnergies canopy pumps and shop strip

In-game view left | Real street view right | Placement and viewing direction A02 both directions marked 7

Visible mistakes The game contains no fuel canopy or pumps and fills the plot with pitched-roof blocks. The rear service and retail frontages and hard-surfaced station layout are missing.

Real target A wide rectangular TotalEnergies canopy has a thin pale fascia with a red edge, raised red brand lettering and dark supporting columns. Its underside has beams and panel divisions. Pump islands, small equipment and protective bases occupy the space below. A low shop strip behind carries signs including bonjour and service or wash labels; the paved forecourt remains largely open.

Step by step instructions for Claude

1. Preserve both arrows marked 7 in A02. Anchor the canopy, pump islands and rear service strip to their separate aerial footprints and reuse the same station as Pairs 5, 6, 8 and 10.

2. Build the canopy as an open roof with slender columns, thin fascia, red perimeter trim and visible underside structure. Preserve open air beneath it; do not turn its footprint into an enclosed multi-storey building.

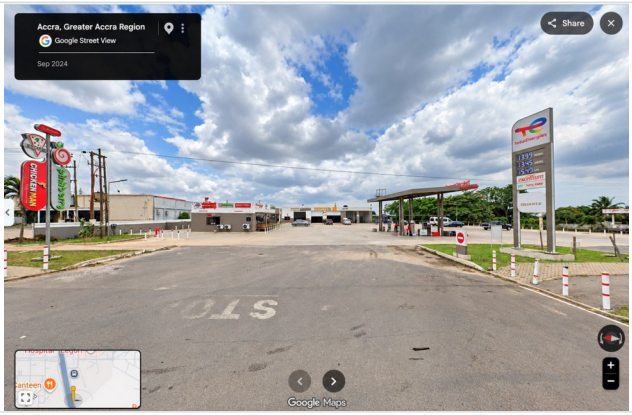

3. Add raised TotalEnergies lettering, the small location text where legible, the visible pump units, hoses, island bases and protective elements. Keep pumps and columns positioned consistently with drive paths; no underground tank layout is inferred.

4. Rebuild the low rear shops with their visible façade colours, openings and signs, including bonjour. Create worn hardstanding and realistic clearance around pumps. Model only the visible service-bay depth and keep bicycle collision shapes simple and accurate.

Acceptance check The wide red-trim canopy should dominate the view, with open drive space and visible pumps beneath. The rear shops must align with Pair 6 rather than becoming another duplicated station row.

Pair 8 Station main access and roadside signs

In-game view left | Real street view right | Placement and viewing direction A04 both directions marked 8

Visible mistakes The game gives the station frontage a row of unrelated pitched-roof blocks and lawn. It lacks the actual broad access, canopy, price pylon, restaurant pylons, directional signs and entry islands.

Real target The main access is a broad paved apron leading into the station. The canopy is to one side and the takeaway building farther back. A tall TotalEnergies price pylon stands near the road; separate Chickenman and Pizzaman brand structures stand on the other side. Short red-and-white posts, grass islands, brick paths and no-entry discs frame drive openings. Worn STOP lettering is on the pavement.

Step by step instructions for Claude

1. Follow both arrows marked 8 in A04 and use the aerial to set the access apron, canopy, shop and service strip. Validate the same driveway from Pair 10 before fixing island shapes.

2. Restore the wide forecourt opening, curved curbs, grass islands, brick footways, striped short posts and visible no-entry discs. Place STOP lettering on the station access surface rather than as a generic highway marking.

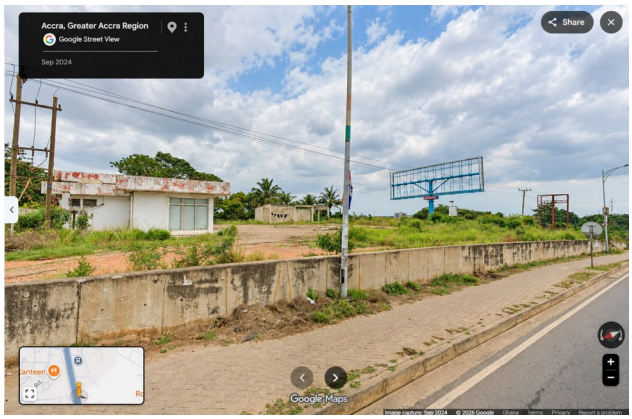

3. Build the TotalEnergies price pylon and separate restaurant brand structures with their actual height relationships, shapes and supports. Treat the photographed price numbers as reference-date display values, not current fuel prices; make the display text editable.

4. Keep the canopy, pumps and rear low buildings shared with Pairs 5 to 7. Finish overhead wires, slender palms and frontage planting, maintaining clear drive paths and avoiding signs or posts in the intended bicycle lane.

Acceptance check The wide station mouth, separate brand pylons, price sign and canopy should be recognisable from the roadside. The entry islands must agree with Pair 10 and leave the observed access openings clear.

Pair 9 Weathered low structures and raised roadside plot

In-game view left | Real street view right | Placement and viewing direction A04 both directions marked 9

Visible mistakes The game places finished two-storey red-roof blocks on level lawn. It misses the small weathered flat-roof building, rough concrete apron, unfinished frame, billboard skeleton and retaining edge.

Real target A small white flat-roof structure has a stained or peeling reddish fascia and a broad pale glazed or closed front. A lower unfinished concrete structure sits behind it. Rough paving, earth and weeds occupy the plot. A large empty blue billboard frame and a separate reddish frame rise above the vegetation. A weathered concrete wall separates the elevated plot from the brick sidewalk.

Step by step instructions for Claude

1. Preserve both directions marked 9 in A04, including the longer curved direction. Register the small buildings, empty billboard frames and raised plot using Pairs 15 and 16. Do not label their functions or businesses from missing signs.

2. Replace the completed campus blocks in the confirmed footprints with the low weathered structure and separate unfinished concrete frame. Preserve flat roof edges, peeling fascia and open frame voids; do not add a finished roof or glazing to the unfinished structure.

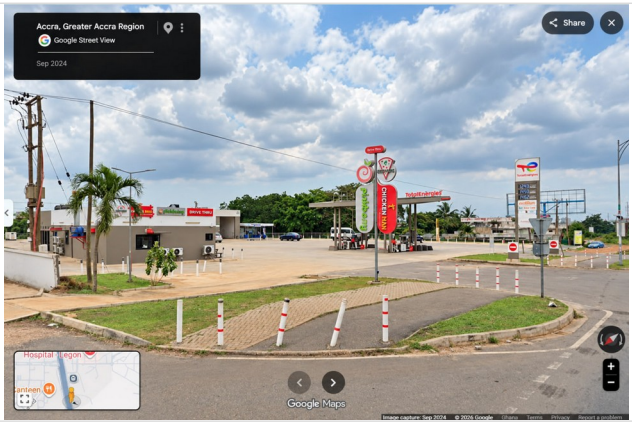

3. Create the worn concrete apron, reddish soil patches, weeds and actual raised ground behind the roadside wall. Use the wall top, sidewalk and access in Pair 16 to calibrate height; leave exact dimensions adjustable.

4. Build the empty blue billboard skeleton on its real support and the separate reddish frame, with no invented advertising face. Restore the brick sidewalk, stained wall, poles, cables and naturally occluding foliage.

Acceptance check The view should show low weathered and unfinished structures on rough raised ground, with empty billboard frames above. Pair 15 must confirm the same façade, and Pair 16 must resolve the access and level transition.

Pair 10 Station entrance checked from the reverse angle

In-game view left | Real street view right | Placement and viewing direction A04 both directions marked 10

Visible mistakes The game's lawn frontage and repeated blocks obscure the station's actual island geometry, sign structures, forecourt and low takeaway building.

Real target This angle shows the TotalEnergies canopy behind a low grey takeaway building and separate restaurant pylons. A rounded grass island is crossed or edged by brick footway and bordered with short striped posts. No-entry discs and the price pylon control the visible drive openings; palms and a low white boundary mark the side.

Step by step instructions for Claude

1. Follow both directions marked 10 in A04 and reuse one station object group. Align this camera to Pair 8's same access and islands; do not move the canopy or shops independently to satisfy each screenshot.

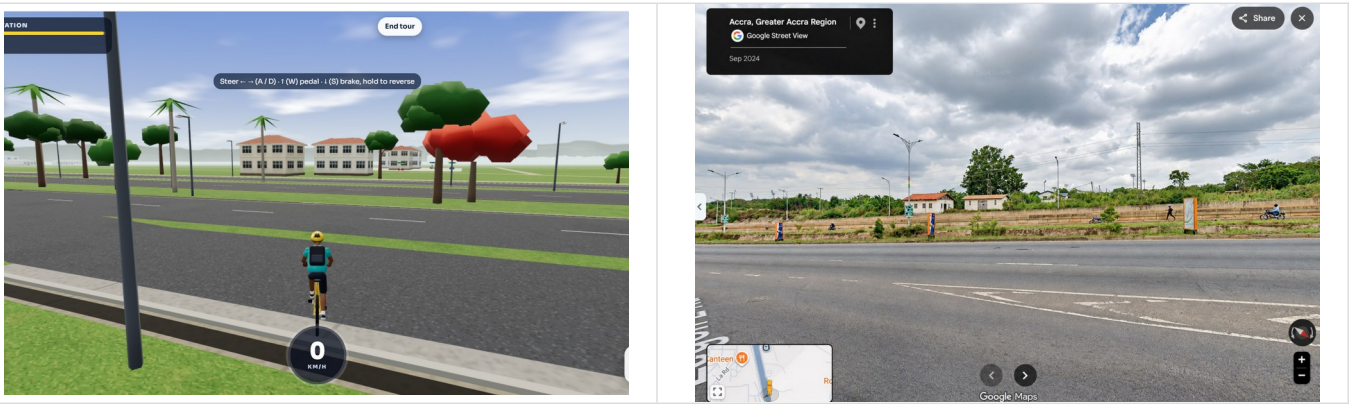

2. Correct the rounded island, asphalt drive edges, brick walking route and striped posts. Keep the observable no-entry sign placements but do not infer unseen road restrictions from screenshot navigation elements.

3. Position the separate Chickenman and Pizzaman sign forms, TotalEnergies price pylon, canopy columns and grey takeaway building using their real relationships. Copy the clear physical signs and fascia text; keep small unreadable copy editable.

4. Add slender palms, low wall, utility supports, wires and worn forecourt surfaces. Test bicycle passage around the actual curbs and islands, and confirm the station entrance does not create a false connection into the highway median.

Acceptance check The reverse-angle capture should match the same canopy, shops and access shown in Pair 8. A top view must reveal one station group and coherent openings around the island.

Pair 11 Small red roof structures above retaining terraces

In-game view left | Real street view right | Placement and viewing direction A01 both directions marked 11

Visible mistakes The game creates several large campus blocks, tall palms and oversized coloured trees on flat ground. The real view has small low buildings behind retaining tiers and rough roadside vegetation.

Real target Across the carriageways are two small cream structures with red roofs and sparse dark openings. They sit behind a stepped retaining edge and low rough planting, with a mature tree and dense scrub farther back. Branching lamps, thin overhead wires and physical roadside boards rise above the verge; the road has visible worn hatch markings.

Step by step instructions for Claude

1. Preserve both directions marked 11 in A01. Use the aerial to place the two small roofed structures and keep them separate from the station and weathered plot. Reduce the template masses to the target low scale.

2. Model their individual roof silhouettes, light walls and restrained openings. Do not add repeated floors or connect the two buildings without visible evidence. Retain the tree behind them rather than a line of giant palms in front.

3. Rebuild the roadside retaining tiers and upper ground relationships. Separate near road, planted strip, far road or pedestrian route and raised land; match exposed wall courses and cap lines without inventing an exact elevation survey.

4. Add patchy grass, low shrubs, mature foliage, branching lamps, wires and physical boards. Reproduce worn road hatching only in its observed lane context and preserve playable carriageways.

Acceptance check The small red-roof structures should sit above the roadside edge at believable scale. Retaining tiers and vegetation must connect coherently to the landscape in Pair 14.

Pair 12 Dense scrub verge and roadside utility corridor

In-game view left | Real street view right | Placement and viewing direction A01 both directions marked 12

Visible mistakes The game has an empty smooth lawn with a distant row of identical blocks. It omits dense scrub, the uneven embankment-like verge, utility tower, wire spans and empty billboard frame.

Real target The opposite roadside is densely planted with shrubs, rough grass and scattered taller trees. The ground rises locally behind a narrow paved or pedestrian strip. A lattice electrical tower and overhead cables cross the view; part of an empty red billboard structure is visible at the left. The nearest vehicle is transient and not part of the site layout.

Step by step instructions for Claude

1. Follow both directions marked 12 in A01 and register this vegetation belt to the correct highway side. Keep the road continuous with Pairs 11 to 14; do not place a residential row in a confirmed open scrub strip.

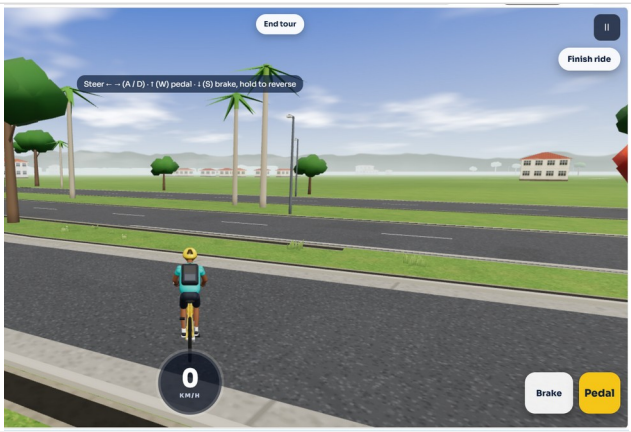

2. Build layered dense vegetation with uneven canopy height and visible gaps, using low shrubs in front and taller crowns behind. Leave any tree-hidden building footprints from the aerial intact; lack of street visibility is not proof of absence.

3. Restore the modest rising verge and paved strip behind the road edge. Use exposed earth and rock-like patches where visible; keep grade adjustable rather than creating a uniform high hill.

4. Add the lattice tower, overhead spans, correct branching streetlights and the partial empty billboard frame. Keep each billboard and tower shared across adjacent views, and omit the reference's foreground pickup from permanent geometry.

Acceptance check The road edge should read as dense uneven scrub with a utility skyline, not open campus lawn. The vegetation belt must remain continuous when viewed from Pair 13.

Pair 13 Planted road separation and rough open landscape

In-game view left | Real street view right | Placement and viewing direction A01 both directions marked 13

Visible mistakes The game substitutes tall stylised palms and regular trees for low planted vegetation, and presents distant generic buildings on uniform flat grass.

Real target The foreground separation has uneven grass, small shrubs and short-stemmed young trees with gaps. Across the carriageway, rough open land blends into larger mature crowns and low dense scrub. Decorative lamps carry physical boards, and a billboard frame stands farther along. Local soil patches and irregular grade break up the greenery.

Step by step instructions for Claude

1. Preserve both directions marked 13 in A01 and establish the road separation width and position from the aerial. Treat this as the same corridor as Pairs 11, 12 and 14, not an additional highway.

2. Replace tall thin-stemmed palms with the observed short-stemmed shrubs and small trees. Use varied crown width, branching height and spacing, retaining only taller specimens supported by the photographs.

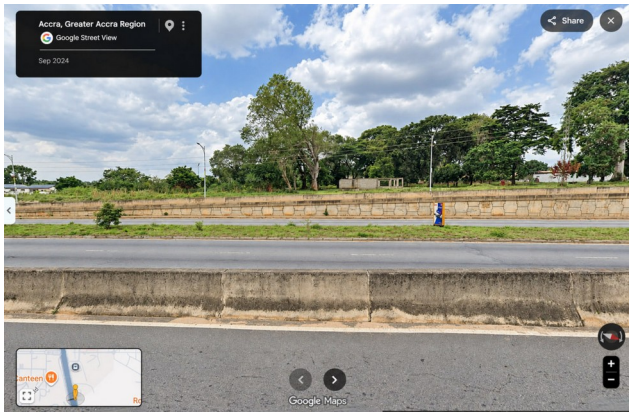

3. Create patchy grass, bare earth and gentle ground irregularity in the foreground strip. Keep low open vegetation across the road and mature crowns farther back; do not invent buildings to fill horizon gaps.

4. Add decorative lamps, their attached physical boards, visible service wires and shared billboard frame. Use worn lane markings and curb edges; transient traffic may be added later without blocking comparison cameras.

Acceptance check The planted strip should stay low enough to preserve views across the road. It must blend into the rough landscape in Pair 12 and raised tree-covered land in Pair 14.

Pair 14 Retaining wall and mature tree covered ground

In-game view left | Real street view right | Placement and viewing direction A01 both directions marked 14

Visible mistakes The game puts an open flat lawn and distant block row behind highway trees. The reference instead has a substantial patterned retaining wall, higher wooded ground and separate foreground concrete divider.

Real target A low foreground concrete divider separates carriageways. Beyond the far road and planted edge, a long retaining face has large rectangular stone-like or concrete panel patterns, horizontal upper bands and weathering. Higher land above carries mature spreading crowns and a tall sparse tree. A small unfinished concrete frame is partly visible within the trees.

Step by step instructions for Claude

1. Follow both directions marked 14 in A01 and set the near divider and far retaining wall as separate scene objects. Do not merge the two because they appear parallel in this side view.

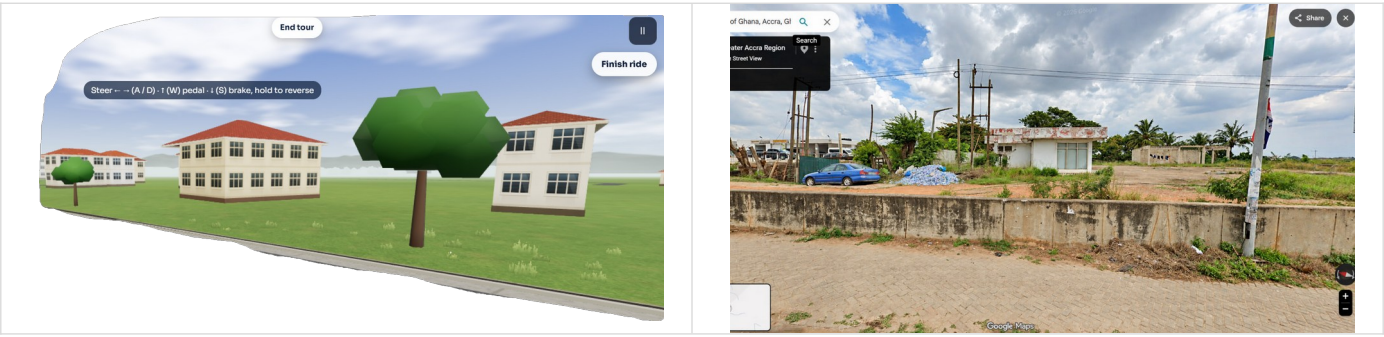

2. Rebuild the raised upper ground behind the far wall, with the actual long panelled face, cap lines, joints and stains. Match relative road-to-wall-to-land heights before adding foliage, leaving dimensions adjustable.

3. Replace the distant template row in confirmed conflicting open areas with the mature tree belt. Keep the small unfinished frame where visible and retain real tree-screened structures supported by the aerial; do not complete the frame as a finished building.

4. Add the sparse tall tree, broad leafy crowns, low verge planting, utility wires, branching lamps and physical small boards. Preserve wall texture as surface relief or mapped coursing rather than painting a uniform brown strip.

Acceptance check The side view should show a concrete divider, far roadway, long patterned retaining wall and wooded upper ground as distinct layers. The unfinished frame must remain visibly incomplete.

Pair 15 Weathered small building and unfinished concrete frame

In-game view left | Real street view right | Placement and viewing direction A02 both directions marked 15

Visible mistakes The game shows finished two-storey buildings with red roofs and a large ornamental tree. The target consists of low weathered and unfinished structures on rough ground above a stained roadside wall.

Real target The nearer low white structure has a flat roof edge, peeling reddish fascia, small side opening and broad pale front panel or glazing. A separate unfinished concrete frame with open bays lies behind it. Rough paving, orange-brown earth, weeds and material piles fill the plot. Utility frames, a palm backdrop and a concrete streetlight pole cross the scene.

Step by step instructions for Claude

1. Preserve both arrows marked 15 in A02 and reconcile these structures with Pair 9's broader plot and Pair 16's oblique access. Do not automatically merge the two footprints or assign a business name.

2. Replace finished template geometry with the low flat-roof white structure and open concrete frame. Preserve observed façade openings and roof-edge wear; the unfinished frame must have exposed columns or beams and empty openings rather than a completed roof and windows.

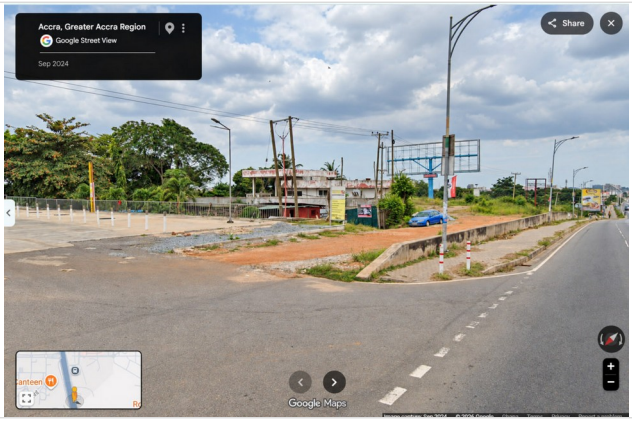

3. Restore stained boundary or retaining wall, brick sidewalk, rough upper paving, exposed soil and weeds. Match the relative heights to Pair 16's entry transition; make unknown measurements adjustable.

4. Add the observed utility frames, wire runs, palm foliage, trimmed or irregular trees and small material piles. Do not model the foreground parked car as a fixed object or turn ambiguous front panels into invented shop interiors.

Acceptance check The low weathered fascia and open unfinished frame should be recognisable from this closer camera. The same plot's wall, ground and billboard must agree with Pairs 9 and 16.

Pair 16 Raised plot access and descending road edge

In-game view left | Real street view right | Placement and viewing direction A04 arrow 16

Visible mistakes The game creates large completed blocks on lawn and a wide angular path. It misses the raised worn plot, low weathered building group, empty billboard, retaining wall transition and actual access mouth.

Real target A broad hard-surfaced access opens into a rough raised plot with metal railing and short white posts. Orange-brown soil and gravel interrupt the paving. Weathered low structures, electrical support frames and an empty blue billboard lie beyond. The wall beside the brick sidewalk tapers or slopes down at the access, while the highway appears to fall away along the view.

Step by step instructions for Claude

1. Use A04 arrow 16 to anchor the access and connect it to the site in Pairs 9 and 15. Build one coordinated plot; use the aerial for individual footprints and do not force every weathered element into a single rectangular building.

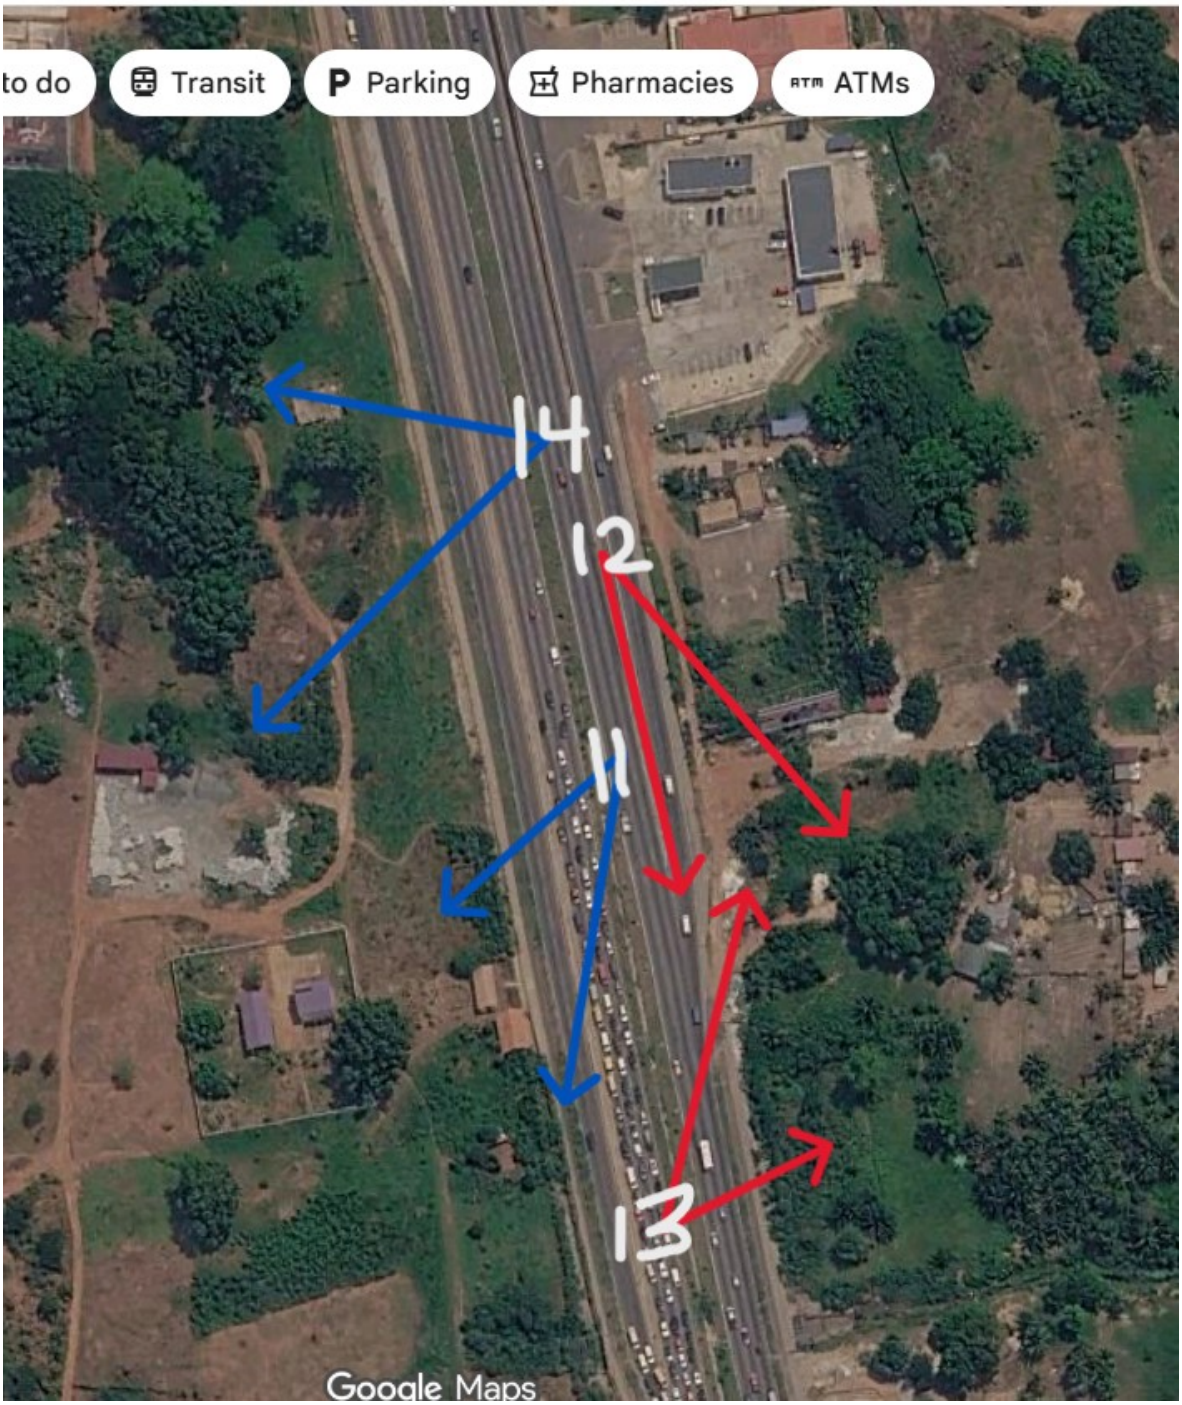

2. Replace the generic lawn path with the observed broad access apron, concrete or gravel transition, railing and short white posts. Preserve its actual connection to the road and keep the roadside walkway continuous where shown.

3. Rebuild the weathered building masses, utility frames and empty billboard consistently with the close and wider references. Retain peeling fascia and open incomplete parts; remove completed template blocks occupying these verified footprints.

4. Use the tapering wall end and sidewalk to shape the local height transition. Match the visible longitudinal road fall and upper plot landing without an arbitrary staircase. Add brick pavement, weeds, poles, signs and overhead wires, then test bicycle movement through the access.

Acceptance check The view should show a believable raised rough plot with a wall that transitions at the access, plus consistent low structures and empty billboard. The road and entry must be traversable without abrupt artificial steps.

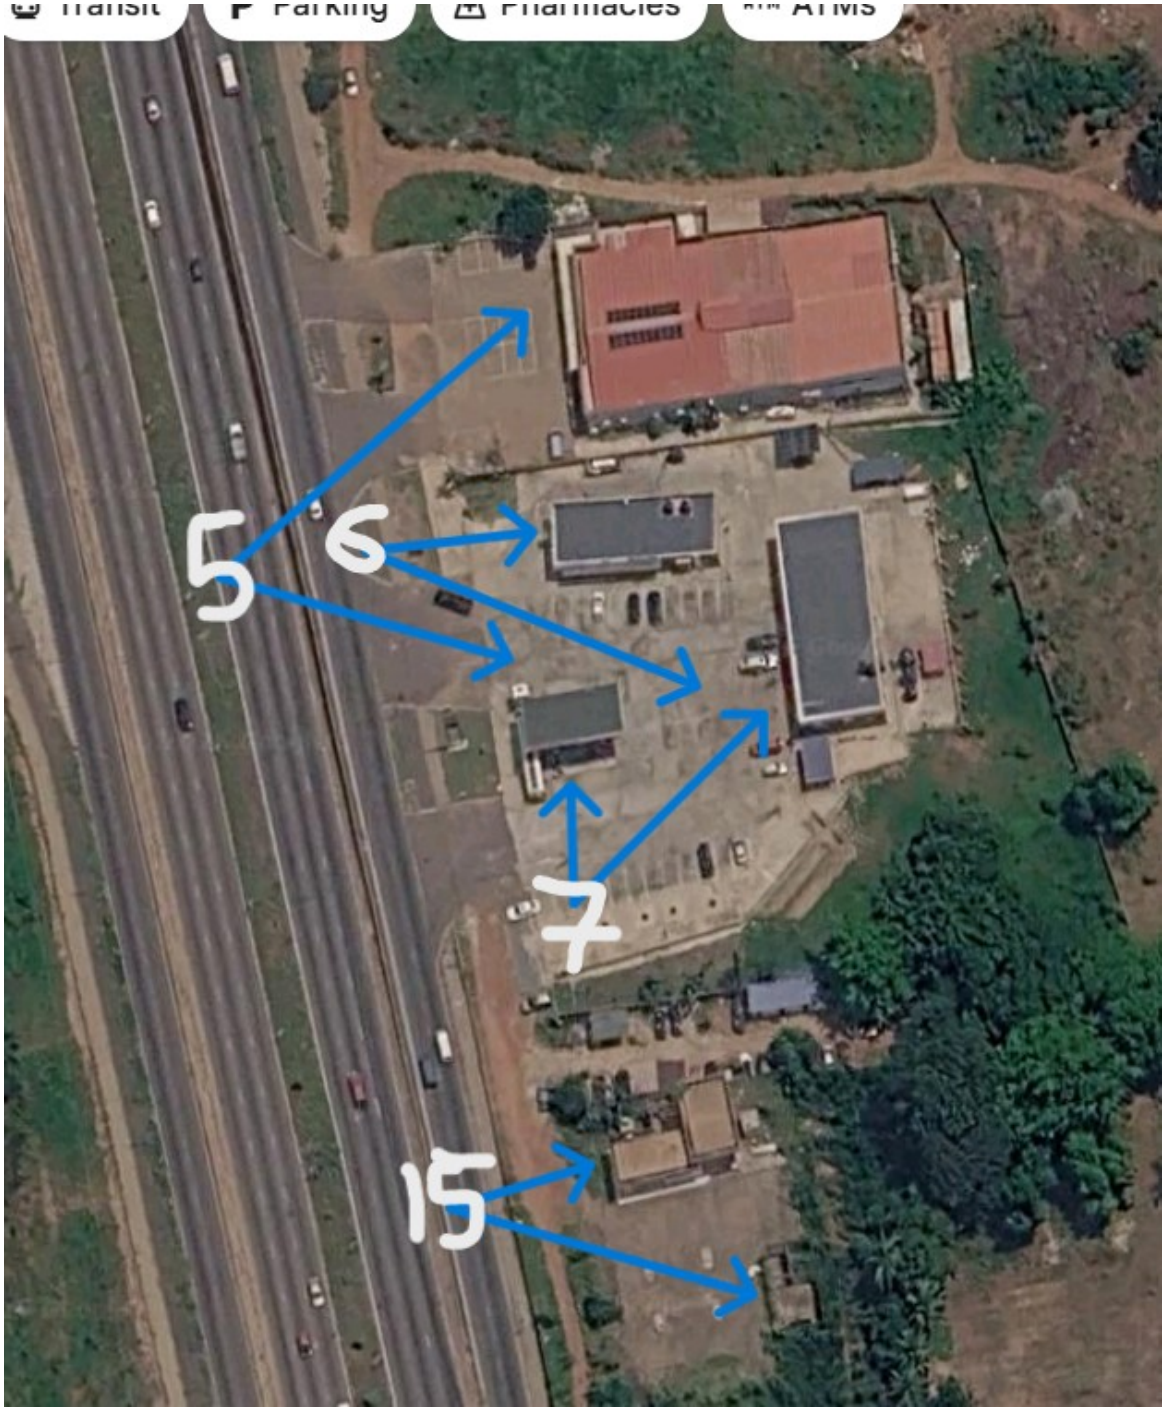

A01 Annotated aerial view Pairs 11 to 14

A01 Screenshot 2026-10-13 075945.png

First uploaded aerial. Preserve all paired directions for numbers 11, 12, 13 and 14, including the road-facing directions. Blue 11 and 14 look toward the west-side small structures and tree-covered ground; red 12 and 13 define the other views and longitudinal corridor relationships. Register roads and land before deciding that photographed trees imply a building location. This aerial gives footprints and vegetation extent, not an elevation survey.

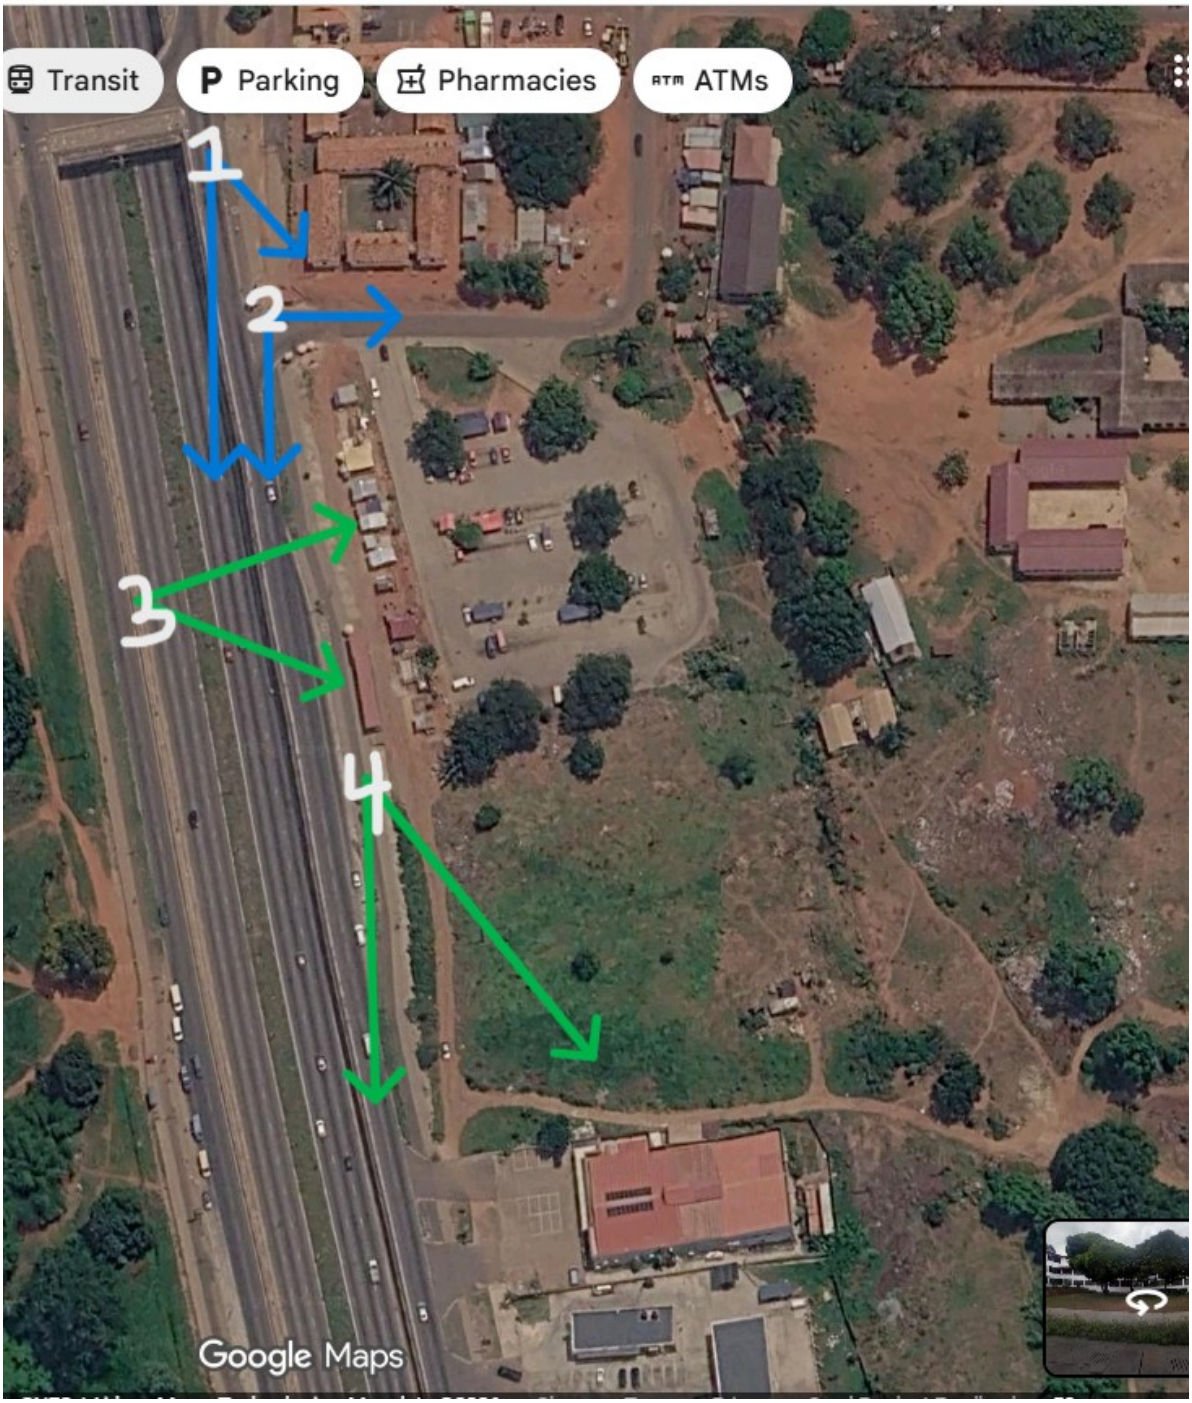

A02 Annotated aerial view Pairs 5 to 7 and 15

A02 Screenshot 2026-10-13 075923.png

Second uploaded aerial. Preserve both directions assigned to 5 and 7, arrow 6 and both directions for 15. The filling-station plot contains separate roof footprints for the canopy, takeaway or shop building, service strip and red-roof neighbour. Street photographs identify their visible elevations and branding. The two small structures south of the station remain separate from the main station group. A canopy footprint must remain open below its roof.

A03 Annotated aerial view Pairs 1 to 4

A03 Screenshot 2026-10-13 074538.png

Third uploaded aerial. Preserve all directions for 1, arrow 2 and both directions for 3 and 4. Register the trading corner, side lane, kiosks, long shelter and open roadside plot to the highway. A crossing structure is visible near the top edge, but this set does not establish its detailed street elevation; use its footprint for context and do not invent bridge deck, stair or ramp dimensions. The thumbnail and map controls are overlays, not site structures.

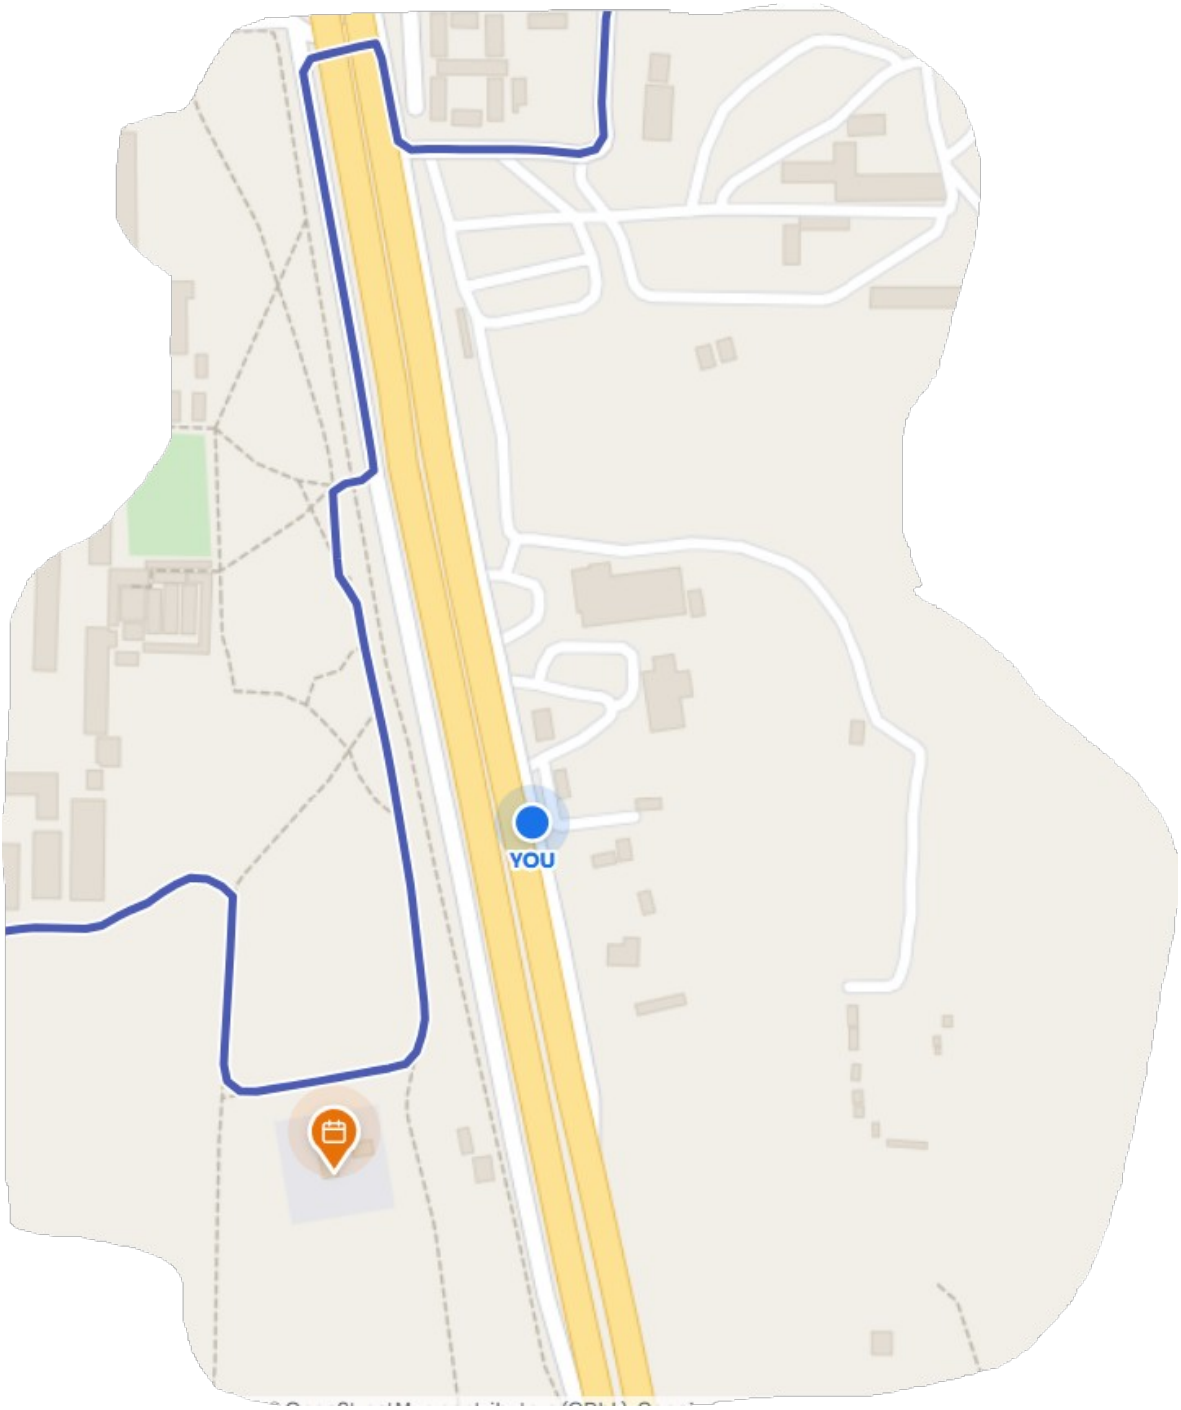

A04 Annotated aerial view Pairs 8 to 10 and 16

A04 Screenshot 2026-10-13 074324.png

Fourth uploaded aerial. Preserve both directions marked 8 and 10, the two directions marked 9 including its curved long line, and arrow 16. Reconcile station entrance cameras around one forecourt, and register the weathered raised plot and access farther along. Paths through rough vegetation do not automatically become public asphalt roads. Overlapping A02 and A04 must yield the same station objects and southern structures.

M01 Game map view Current game map

M01 image(20261013-091456).png

The fifth image is a flat game map. Its blue route, blue YOU dot, orange icon, labels and black map mask are UI overlays. Do not model them physically. Inspect the existing map data and generator: register the divided highway, side lane, access openings and several actual footprints against the real aerials. The map does not establish building height, façade material, retaining-wall height or terrain grade. Use street images for those local visible relationships.

Consolidated Claude prompt Part 1 Scope and shared layout

Inspect and correct the existing University of Ghana bicycle exploration game along the Legon overhead, Legon First, Family Health, Total filling station, Pizzaman lane and Okponglo route identified by the owner. Use this brief's 16 game versus real pairs, four annotated real aerials and current game map. Change the existing scene and map-generation pipeline where needed; preserve completed areas elsewhere and existing bicycle controls, movement and collision behaviour.

Preserve pair order and every owner annotation. A01 is the first uploaded aerial and covers 11 to 14. A02 covers 5 to 7 and 15. A03 covers 1 to 4. A04 covers 8 to 10 and 16. Multiple directions under the same number must all be retained, including road-facing and curved directions. Arrows locate the views; they do not prescribe wall geometry. Do not convert circles, screenshot labels, map pins, route lines, the YOU dot, HUD elements or Street View overlays into objects.

Read the existing map source data, feature IDs and scene generator. Check coordinate projection, origin, scale, orientation, filtering, road classes and default building templates. Retrieve and use relevant features already in that map data before adding explicit reference-based overrides. Align the divided highway, side lane, access gaps and several distinctive footprints to the four aerials; correct any transform or feature filtering responsible for misplaced or missing structures.

Create shared object identities for the trading corner and kiosk line in 1 to 3, open plot and Legon 1st sign in 4, filling station and commercial frontage in 5 to 8 and 10, weathered raised plot and incomplete structures in 9, 15 and 16, and roadside landscape and retaining edges in 11 to 14. Do not duplicate the filling station, billboard frames, utility supports or weathered structures for separate photographs.

Match camera heading, position, height and field of view before judging dimensions. Aerials establish footprints and circulation; street views establish visible massing, surfaces and local relative ground heights. Keep dimensions adjustable. The route includes named landmarks such as Family Health, but these photographs do not conclusively assign every unnamed structure to them. Do not put a landmark name onto an unverified building. If a view cannot be located, ask directly Where was Pair N taken using its actual pair number.

Consolidated Claude prompt Part 2 Buildings and terrain

Prioritise roads and placement, building massing and terrain, then façades, signs and decorative details. Delete or replace default campus blocks only where registered footprints or overlapping references establish a conflict. Trees and roofs may hide real structures; occlusion alone is not evidence of absence. Preserve confirmed hidden footprints conservatively and avoid invented interiors, exact measurements or unobserved connections.

Rebuild the trading corner and side lane with curved curbs, brick pedestrian paving, short striped posts, individually sized umbrellas, kiosks and long shallow sheltered structures. Put them on reddish earth and worn hardstanding with actual pedestrian gaps and mature trees behind. Distinguish open stalls, enclosed shops and shelter forms. Do not use one generic bus-station structure for all roofs or assume every roof is a bus stop.

Rebuild one TotalEnergies station group. Use a wide open canopy with thin pale fascia, red edge, dark columns, visible underside beams and raised TotalEnergies lettering. Place pump units and islands below, with generous drive clearance. Behind it, build the low grey takeaway volume with white fascia, dark windows, exterior air-conditioning units and Chickenman, Pizzaman and DRIVE THRU signs. Keep the low service strip, deep open bays and bonjour or service signs distinct, and keep the large red-roof neighbouring building at its aerial footprint.

Restore the broad paved forecourt, true access openings, rounded grass islands, brick footways, striped bollards and observed no-entry discs. Include the worn STOP marking on the station access, the separate restaurant pylons and TotalEnergies price sign. Photograph prices are reference-date display values; make them editable rather than describing them as current prices. Avoid copying a shop name or smaller sign text that cannot be read confidently.

Rebuild the weathered raised plot with small flat-roof white structures, peeling reddish fascia, rough apron, soil and weeds. Preserve the separate unfinished concrete frame with open bays and exposed members; do not complete it as a finished building. Add the empty blue billboard skeleton and separate reddish frame only where observed, without invented advertisements. Keep the billboard supports and building relationships consistent across 9, 15 and 16.

Correct local terrain: distinguish road carriageways, median or concrete divider, planted separation, sidewalk, far retaining wall and upper land. Restore the long patterned wall and mature tree-covered ground in 14, the retaining tiers and small red-roof buildings in 11, dense verge in 12 and low planted strip in 13. At 16, taper the wall at the access and shape a believable transition to the raised plot. Match visible longitudinal road fall conservatively; do not flatten everything or invent exact slope angles, deep trenches or stairways. The overhead crossing is only partly established by the aerial; keep detailed bridge geometry unchanged until supported by adequate references.

Consolidated Claude prompt Part 3 Environment and acceptance

Replace uniform grass and oversized stylised or orange trees with the observed mix of bare reddish earth, patchy grass, short-stemmed shrubs and small trees, dense scrub, mature spreading crowns and sparse tall trees. Keep foliage that screens buildings and unfinished structures. Vary trunk height, branching, crown width and canopy density rather than planting one regular tree row.

Restore physical walls, retaining faces, cap lines, panel or course patterns, joints, staining and weathering. Add brick pavement, worn concrete, gravel, curb returns, drain inlets or grates and visible soil changes. Use the correct visible local height relationships and protect bicycle rideability through road and entrance transitions.

Add paired electrical supports, poles, lattice towers, crossbars and visible overhead wire spans with coherent attachments and sag. Use the slender decorative branching streetlights visible in the references. Build the Legon 1st open frame and its small top panel, empty billboard skeletons, façade branding, roadside boards and stall panels as physical assets. Readable letters need proper placement and depth where the reference shows relief. Keep unreadable copy editable. No traffic light is clearly established in these supplied views; require supporting reference evidence before adding one.

Implement every pair-specific correction and acceptance check. Return 16 comparison screenshots from matched viewpoints and a drone overview registered to the annotated aerials, showing one coherent station, trading corner, weathered plot and highway landscape. Report changed scene objects, map-data or generator fixes, uncertain measurements and any location questions. Do not count transient vehicles, pedestrians, photo distortions, black image masks or the Street View camera vehicle as permanent infrastructure.

Test bicycle movement along the corridor and intended side lane or forecourt access. Verify steering and braking remain intact; curbs, dividers, walls, canopy columns, pumps and gates have appropriate collision; no revised terrain creates abrupt hidden steps; and foliage or wire detail does not cause unacceptable performance. Confirm no shared structure was duplicated and no completed zone elsewhere was accidentally changed. Judge completion by matched reference views and coherent aerial layout before adding decorative extras.
